Abstract

The DAKOTA (Design Analysis Kit for Optimization and Terascale Applications) toolkit provides a flexible and extensible interface between simulation codes and iterative analysis methods. DAKOTA contains algorithms for optimization with gradient and nongradient-based methods; uncertainty quantification with sampling, reliability, and stochastic expansion methods; parameter estimation with nonlinear least squares methods; and sensitivity/variance analysis with design of experiments and parameter study methods. These capabilities may be used on their own or as components within advanced strategies such as surrogate-based optimization, mixed integer nonlinear programming, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the DAKOTA toolkit provides a flexible and extensible problem-solving environment for design and performance analysis of computational models on high performance computers.

This report serves as a developers manual for the DAKOTA software and describes the DAKOTA class hierarchies and their interrelationships. It derives directly from annotation of the source code and provides detailed class documentation, including all member functions and attributes.

Contents

DAKOTA Developers Manual

Author:

Brian M. Adams, William J. Bohnhoff, Keith R. Dalbey, John P. Eddy, Michael S. Eldred, Patricia D. Hough, Sophia Lefantzi, Laura P. Swiler, Dena M. Vigil

1.1 Introduction

The DAKOTA (Design Analysis Kit for Optimization and Terascale Applications) toolkit provides a flexible, extensible interface between analysis codes and iteration methods. DAKOTA contains algorithms for optimization with gradient and nongradient-based methods, uncertainty quantification with sampling, reliability, stochastic expansion, and interval estimation methods, parameter estimation with nonlinear least squares methods, and sensitivity/variance analysis with design of experiments and parameter study capabilities. (Solution verification and Bayesian approaches are also in development.) These capabilities may be used on their own or as components within advanced algorithms such as surrogate-based optimization, mixed integer nonlinear programming, mixed aleatory-epistemic uncertainty quantification, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the DAKOTA toolkit provides a flexible problem-solving environment for design and performance analysis of computational models on high performance computers.

The Developers Manual focuses on documentation of DAKOTA design principles and class structures; it derives principally from annotated source code. For information on input command syntax, refer to the [Reference Manual](#), and for more details on DAKOTA features and capabilities, refer to the [Users Manual](#).

1.2 Overview of DAKOTA

In DAKOTA, the *strategy* creates and manages *iterators* and *models*. In the simplest case, the strategy creates a single iterator and a single model and executes the iterator on the model to perform a single study. In a more advanced case, a hybrid optimization strategy might manage a global optimizer operating on a low-fidelity model in coordination with a local optimizer operating on a high-fidelity model. And on the high end, a surrogate-based optimization under uncertainty strategy would employ an uncertainty quantification iterator nested within an optimization iterator and would employ truth models layered within surrogate models. Thus, iterators and

models provide both stand-alone capabilities as well as building blocks for more sophisticated studies.

A model contains a set of *variables*, an *interface*, and a set of *responses*, and the iterator operates on the model to map the variables into responses using the interface. Each of these components is a flexible abstraction with a variety of specializations for supporting different types of iterative studies. In a DAKOTA input file, the user specifies these components through strategy, method, model, variables, interface, and responses keyword specifications.

The use of class hierarchies provides a mechanism for extensibility in DAKOTA components. In each of the various class hierarchies, adding a new capability typically involves deriving a new class and providing a set of virtual function redefinitions. These redefinitions define the coding portions specific to the new derived class, with the common portions already defined at the base class. Thus, with a small amount of new code, the existing facilities can be extended, reused, and leveraged for new purposes. The following sections tour DAKOTA's class organization.

1.2.1 Strategies

Class hierarchy: [Strategy](#).

Strategies provide a control layer for creation and management of iterators and models. Specific strategies include:

- [SingleMethodStrategy](#): the simplest strategy. A single iterator is run on a single model to perform a single study.
- [HybridStrategy](#): hybrid minimization using a set of iterators employing a corresponding set of models of varying fidelity. Coordination approaches among the iterators include collaborative, embedded, and sequential approaches, as embodied in the [CollaborativeHybridStrategy](#), [EmbeddedHybridStrategy](#), and [SequentialHybridStrategy](#) derived classes.
- [ConcurrentStrategy](#): two similar algorithms are available: (1) multi-start iteration from several different starting points, and (2) pareto set optimization for several different multiobjective weightings. Employs a single iterator with a single model, but runs multiple instances of the iterator concurrently for different settings within the model.

1.2.2 Iterators

Class hierarchy: [Iterator](#). Iterator implementations may choose to split operations up into run-time phases as described in [Understanding Iterator Flow](#).

The iterator hierarchy contains a variety of iterative algorithms for optimization, uncertainty quantification, non-linear least squares, design of experiments, and parameter studies. The hierarchy is divided into [Minimizer](#) and [Analyzer](#) branches. The [Minimizer](#) classes address optimization and deterministic calibration and are grouped into:

- Optimization: [Optimizer](#) provides a base class for the [DOTOptimizer](#), [CONMINOptimizer](#), [NPSOLOptimizer](#), [NLPQLPOptimizer](#), and [SNLLOptimizer](#) gradient-based optimization libraries and the [APPSOptimizer](#), [COLINOptimizer](#), [JEGAOptimizer](#), and [NCSUOptimizer](#) nongradient-based optimization methods and libraries.
- Parameter estimation: [LeastSq](#) provides a base class for [NL2SOLLeastSq](#), a least-squares solver based on NL2SOL, [SNLLLeastSq](#), a Gauss-Newton least-squares solver, and [NLSSOLLeastSq](#), an SQP-based least-squares solver.

- Surrogate-based minimization (both optimization and nonlinear least squares): [SurrBasedMinimizer](#) provides a base class for [SurrBasedLocalMinimizer](#), [SurrBasedGlobalMinimizer](#), and [EffGlobalMinimizer](#). The surrogate-based local and global methods employ a single iterator with any of the available [SurrogateModel](#) capabilities (local, multipoint, or global data fits or hierarchical approximations) and perform a sequence of approximate optimizations, each involving build, optimize, and verify steps. The efficient global method, on the other hand, hard-wires a recursion involving Gaussian process surrogate models coupled with the DIRECT global optimizer to maximize an expected improvement function.

The [Analyzer](#) classes are grouped into:

- Uncertainty quantification: [NonD](#) provides a base class for non-deterministic methods [NonDSampling](#), [NonDReliability](#) (reliability analysis), [NonDExpansion](#) (stochastic expansion methods), and [NonDInterval](#) (interval-based epistemic methods). Bayesian calibration methods are prototyped in [NonDBayesCalibration](#).
 - [NonDSampling](#) is further specialized with the [NonDLHSSampling](#) class for Latin hypercube and Monte Carlo sampling, the [NonDIncremLHSSampling](#) class for incremental Latin hypercube sampling, and [NonDAdaptImpSampling](#) for multimodal adaptive importance sampling.
 - [NonDReliability](#) is further specialized with local and global methods ([NonDLocalReliability](#) and [NonDGlobalReliability](#)).
 - [NonDExpansion](#) includes specializations for generalized polynomial chaos ([NonDPolynomialChaos](#)) and stochastic collocation ([NonDStochCollocation](#)) and is supported by the [NonDIntegration](#) helper class, which supplies cubature, tensor-product quadrature and Smolyak sparse grid methods ([NonDCubature](#), [NonDQuadrature](#), and [NonDSparseGrid](#)).
 - [NonDInterval](#) provides a base class for epistemic interval-based UQ methods. Three interval analysis approaches are provided: LHS ([NonDLHSInterval](#)), efficient global optimization ([NonDGloballInterval](#)), and local optimization ([NonDLocalInterval](#)). Each of these three has specializations for single interval ([NonDLHSSingleInterval](#), [NonDGlobalSingleInterval](#), [NonDLocalSingleInterval](#)) and Dempster-Shafer Theory of Evidence ([NonDLHSEvidence](#), [NonDGlobalEvidence](#), [NonDLocalEvidence](#)) approaches.
- Parameter studies and design of experiments: [PStudyDACE](#) provides a base class for [ParamStudy](#), which provides capabilities for directed parameter space interrogation, [PSUADEDesignCompExp](#), which provides access to the Morris One-At-a-Time (MOAT) method for parameter screening, and [DDACEDesignCompExp](#) and [FSUDesignCompExp](#), which provide for parameter space exploration through design and analysis of computer experiments. [NonDLHSSampling](#) from the uncertainty quantification branch also supports design of experiments when in `all_variables` mode.
- Solution verification studies: [Verification](#) provides a base class for [RichExtrapVerification](#) (verification via Richardson extrapolation) and other solution verification methods in development.

1.2.3 Models

Class hierarchy: [Model](#).

The model classes are responsible for mapping variables into responses when an iterator makes a function evaluation request. There are several types of models, some supporting sub-iterators and sub-models for enabling layered and nested relationships. When sub-models are used, they may be of arbitrary type so that a variety of recursions are supported.

- **SingleModel**: variables are mapped into responses using a single [Interface](#) object. No sub-iterators or sub-models are used.
- **SurrogateModel**: variables are mapped into responses using an approximation. The approximation is built and/or corrected using data from a sub-model (the truth model) and the data may be obtained using a sub-iterator (a design of experiments iterator). [SurrogateModel](#) has two derived classes: [DataFitSurrModel](#) for data fit surrogates and [HierarchSurrModel](#) for hierarchical models of varying fidelity. The relationship of the sub-iterators and sub-models is considered to be "layered" since they are not used as part of every response evaluation on the top level model, but rather used periodically in surrogate update and verification steps.
- **NestedModel**: variables are mapped into responses using a combination of an optional [Interface](#) and a sub-iterator/sub-model pair. The relationship of the sub-iterators and sub-models is considered to be "nested" since they are used to perform a complete iterative study as part of every response evaluation on the top level model.
- **RecastModel**: recasts the inputs and outputs of a sub-model for the purposes of variable transformations (e.g., variable scaling, transformations to standardized random variables) and problem reformulation (e.g., multiobjective optimization, response scaling, augmented Lagrangian merit functions, expected improvement).

1.2.4 Variables

Class hierarchy: [Variables](#).

The [Variables](#) class hierarchy manages design, aleatory uncertain, epistemic uncertain, and state *variable types* for continuous, discrete integer, and discrete real *domain types*. This hierarchy is specialized according to how the domain types are managed:

- **MixedVariables**: domain type distinctions are retained, such that separate continuous, discrete integer, and discrete real domain types are managed. This is the default Variable perspective, and draws its name from "mixed continuous-discrete" optimization.
- **MergedVariables**: domain types are combined through relaxation of discrete constraints; i.e., continuous and discrete variables are merged into continuous arrays through relaxation of integrality (for discrete integer ranges) or set membership (for discrete integer or discrete real sets) requirements. The branch and bound minimizer is the only method using this approach at present.

Whereas domain types are controlled through the derived class selection, selection of active variable types are handled within each of these derived classes using variable views. These permit different algorithms to work on different subsets of variables. For details, see [Working with Variable Containers and Views](#).

The [Constraints](#) hierarchy manages bound, linear, and nonlinear constraints and utilizes the same specializations for managing bounds on the variables (see [MixedConstraints](#) and [MergedConstraints](#)).

1.2.5 Interfaces

Class hierarchy: [Interface](#).

Interfaces provide access to simulation codes or, conversely, approximations based on simulation code data. In the simulation case, an [ApplicationInterface](#) is used. [ApplicationInterface](#) is specialized according to the simulation invocation mechanism, for which the following nonintrusive approaches

- [SysCallApplicInterface](#): the simulation is invoked using a system call (the C function `system()`). Asynchronous invocation utilizes a background system call. Utilizes the [SysCallAnalysisCode](#) class to define syntax for input filter, analysis code, output filter, or combined spawning, which in turn utilize the [CommandShell](#) utility.
- [ForkApplicInterface](#): the simulation is invoked using a fork (the `fork/exec/wait` family of functions). Asynchronous invocation utilizes a nonblocking fork. Utilizes the [ForkAnalysisCode](#) class for lower level fork operations.

and the following semi-intrusive approach

- [DirectApplicInterface](#): the simulation is linked into the DAKOTA executable and is invoked using a procedure call. Asynchronous invocations will utilize nonblocking threads (capability not yet available).

are supported. Scheduling of jobs for asynchronous local, message passing, and hybrid parallelism approaches is performed in the [ApplicationInterface](#) class, with job initiation and job capture specifics implemented in the derived classes.

In the approximation case, global, multipoint, or local data fit approximations to simulation code response data can be built and used as surrogates for the actual, expensive simulation. The interface class providing this capability is

- [ApproximationInterface](#): builds an approximation using data from a truth model and then employs the approximation for mapping variables to responses. This class contains an array of [Approximation](#) objects, one per response function, which support a variety of approximation types using the different [Approximation](#) derived classes. These include [SurfpackApproximation](#) (provides kriging, MARS, moving least squares, neural network, polynomial regression, and radial basis functions), [GaussProcApproximation](#) (Gaussian process models), [PecosApproximation](#) (multivariate orthogonal and Lagrange interpolation polynomials from Pecos), [TANA3Approximation](#) (two-point adaptive nonlinearity approximation), and [TaylorApproximation](#) (local Taylor series).

which is an essential component within the [DataFitSurrModel](#) capability described above in [Models](#).

1.2.6 Responses

Class: [Response](#).

The [Response](#) class provides an abstract data representation of response functions and their first and second derivatives (gradient vectors and Hessian matrices). These response functions can be interpreted as objective functions and constraints (optimization data set), residual functions and constraints (least squares data set), or generic response functions (uncertainty quantification data set). This class is not currently part of a class hierarchy, since the abstraction has been sufficiently general and has not required specialization.

1.3 Services

A variety of services are provided in DAKOTA for parallel computing, failure capturing, restart, graphics, etc. An overview of the classes and member functions involved in performing these services is included below.

- Multilevel parallel computing: DAKOTA supports multiple levels of nested parallelism. A strategy can manage concurrent iterators, each of which manages concurrent function evaluations, each of which manages concurrent analyses executing on multiple processors. Partitioning of these levels with MPI communicators is managed in [ParallelLibrary](#) and scheduling routines for the levels are part of [Strategy](#), [ApplicationInterface](#), and [ForkApplicInterface](#).
- Parsing: DAKOTA employs the NIDR parser (New Input Deck Reader) to retrieve information from user input files. Parsing options are processed in [CommandLineHandler](#) and parsing occurs in [ProblemDescDB::manage_inputs\(\)](#) called from [main.C](#). NIDR uses the keyword handlers in the [NIDR-ProblemDescDB](#) derived class to populate data within the [ProblemDescDB](#) base class, which maintains a [DataStrategy](#) specification and lists of [DataMethod](#), [DataModel](#), [DataVariables](#), [DataInterface](#), and [DataResponses](#) specifications. Procedures for modifying the parsing subsystem are described in [Instructions for Modifying DAKOTA's Input Specification](#).
- Failure capturing: Simulation failures can be trapped and managed using exception handling in [ApplicationInterface](#) and its derived classes.
- Restart: DAKOTA maintains a record of all function evaluations both in memory (for capturing any duplication) and on the file system (for restarting runs). Restart options are processed in [CommandLineHandler](#) and retrieved in [ParallelLibrary::specify_outputs_restart\(\)](#), restart file management occurs in [ParallelLibrary::manage_outputs_restart\(\)](#), and restart file insertions occur in [ApplicationInterface](#). The [dakota_restart_util](#) executable, built from [restart_util.C](#), provides a variety of services for interrogating, repairing, concatenating, and post-processing restart files.
- Memory management: DAKOTA employs the techniques of reference counting and representation sharing through the use of letter-envelope and handle-body idioms (Coplien, "Advanced C++"). The former idiom provides for memory efficiency and enhanced polymorphism in the following class hierarchies: [Strategy](#), [Iterator](#), [Model](#), [Variables](#), [Constraints](#), [Interface](#), [ProblemDescDB](#), and [Approximation](#). The latter idiom provides for memory efficiency in data-intensive classes which do not involve a class hierarchy. The [Response](#) and parser data ([DataStrategy](#), [DataMethod](#), [DataModel](#), [DataVariables](#), [DataInterface](#), and [DataResponses](#)) classes use this idiom. When managing reference-counted data containers (e.g., [Variables](#) or [Response](#) objects), it is important to properly manage shallow and deep copies, to allow for both efficiency and data independence as needed in a particular context.
- [Graphics](#): DAKOTA provides 2D iteration history graphics using Motif widgets. [Graphics](#) data can also be cataloged in a tabular data file for post-processing with 3rd party tools such as Matlab, Tecplot, etc. These capabilities are encapsulated within the [Graphics](#) class.

1.4 Development Practices and Guidance

The following links provide guidance for core software components or specific development activities:

- [Coding Style Guidelines and Conventions](#) - coding practices used by the DAKOTA development team.

- [Instructions for Modifying DAKOTA's Input Specification](#) - how to interact with N IDR and the associated DAKOTA classes.
- [Interfacing with DAKOTA as a Library](#) - embed DAKOTA as a service within your application.
- [Understanding Iterator Flow](#) - explanation of the full granularity of steps in [Iterator](#) execution.
- [Performing Function Evaluations](#) - an overview of the classes and member functions involved in performing function evaluations synchronously or asynchronously.
- [Working with Variable Containers and Views](#) - discussion of data storage for variables and explanation of active and inactive views of this data.

1.5 Additional Resources

Additional development resources include:

- The DAKOTA Developer Portal linked from <http://dakota.sandia.gov/developer/> includes information on getting started as a developer and links to project management resources.
- Project web pages are maintained at <http://dakota.sandia.gov/> including links to frequently asked questions, documentation, publications, mailing lists, and other resources.

Coding Style Guidelines and Conventions

Chapter 3

Introduction

Common code development practices can be extremely useful in multiple developer environments. Particular styles for code components lead to improved readability of the code and can provide important visual cues to other developers. Much of this recommended practices document is borrowed from the CUBIT mesh generation project, which in turn borrows its recommended practices from other projects, yielding some consistency across Sandia projects. While not strict requirements, these guidelines suggest a best-practices starting point for coding in DAKOTA.

Chapter 4

C++/c Style Guidelines

Style guidelines involve the ability to discern at a glance the type and scope of a variable or function.

4.1 Class and variable styles

Class names should be composed of two or more descriptive words, with the first character of each word capitalized, e.g.:

```
class ClassName;
```

Class member variables should be composed of two or more descriptive words, with the first character of the second and succeeding words capitalized, e.g.:

```
double classMemberVariable;
```

Temporary (i.e. local) variables are lower case, with underscores separating words in a multiple word temporary variable, e.g.:

```
int temporary_variable;
```

Constants (i.e. parameters) and enumeration values are upper case, with underscores separating words, e.g.:

```
const double CONSTANT_VALUE;
```

4.2 Function styles

Function names are lower case, with underscores separating words, e.g.:

```
int function_name();
```

There is no need to distinguish between member and non-member functions by style, as this distinction is usually clear by context. This style convention allows member function names which set and return the value of a similarly-named private member variable, e.g.:

```

int memberVariable;
void member_variable(int a) { // set
    memberVariable = a;
}
int member_variable() const { // get
    return memberVariable;
}

```

In cases where the data to be set or returned is more than a few bytes, it is highly desirable to employ const references to avoid unnecessary copying, e.g.:

```

void continuous_variables(const RealVector& c_vars) { // set
    continuousVariables = c_vars;
}
const RealVector& continuous_variables() const {           // get
    return continuousVariables;
}

```

Note that it is not necessary to always accept the returned data as a const reference. If it is desired to be able change this data, then accepting the result as a new variable will generate a copy, e.g.:

```

// reference to continuousVariables cannot be changed
const RealVector& c_vars = model.continuous_variables();
// local copy of continuousVariables can be changed
RealVector c_vars = model.continuous_variables();

```

4.3 Miscellaneous

Appearance of typedefs to redefine or alias basic types is isolated to a few header files (`data_types.h`, `template_defs.h`), so that issues like program precision can be changed by changing a few lines of typedefs rather than many lines of code, e.g.:

```
typedef double Real;
```

`xemacs` is the preferred source code editor, as it has C++ modes for enhancing readability through color (turn on "Syntax highlighting"). Other helpful features include "Paren highlighting" for matching parentheses and the "New Frame" utility to have more than one window operating on the same set of files (note that this is still the same edit session, so all windows are synchronized with each other). Window width should be set to 80 internal columns, which can be accomplished by manual resizing, or preferably, using the following alias in your shell resource file (e.g., `.cshrc`):

```
alias xemacs "xemacs -g 81x63"
```

where an external width of 81 gives 80 columns internal to the window and the desired height of the window will vary depending on monitor size. This window width imposes a coding standard since you should avoid line wrapping by continuing anything over 80 columns onto the next line.

Indenting increments are 2 spaces per indent and comments are aligned with the code they describe, e.g.:

```

void abort_handler(int code)
{
    int initialized = 0;
    MPI_Initialized(&initialized);
    if (initialized) {
        // comment aligned to block it describes
        int size;

```

```
    MPI_Comm_size(MPI_COMM_WORLD, &size);
    if (size>1)
        MPI_Abort(MPI_COMM_WORLD, code);
    else
        exit(code);
}
else
    exit(code);
}
```

Also, the continuation of a long command is indented 2 spaces, e.g.:

```
const String& iterator_scheduling
= problem_db.get_string("strategy.iterator_scheduling");
```

and similar lines are aligned for readability, e.g.:

```
cout << "Numerical gradients using " << finiteDiffStepSize*100. << "%"
<< finiteDiffType << " differences\nto be calculated by the "
<< methodSource << " finite difference routine." << endl;
```

Lastly, #ifdef's are not indented (to make use of syntax highlighting in xemacs).

Chapter 5

File Naming Conventions

In addition to the style outlined above, the following file naming conventions have been established for the DAKOTA project.

File names for C++ classes should, in general, use the same name as the class defined by the file. Exceptions include:

- with the introduction of the [Dakota](#) namespace, base classes which previously utilized prepended Dakota identifiers can now safely omit the identifiers. However, since file names do not have namespace protection from name collisions, they retain the prepended Dakota identifier. For example, a class previously named DakotaModel which resided in DakotaModel.[CH], is now [Dakota::Model](#) (class [Model](#) in namespace Dakota) residing in the same filenames. The retention of the previous filenames reduces the possibility of multiple instances of a Model.H causing problems. Derived classes (e.g., [NestedModel](#)) do not require a prepended Dakota identifier for either the class or file names.
- in a few cases, it is convenient to maintain several closely related classes in a single file, in which case the file name may reflect the top level class or some generalization of the set of classes (e.g., DakotaResponse.[CH] files contain [Dakota::Response](#) and [Dakota::ResponseRep](#) classes, and DakotaBinStream.[CH] files contain the [Dakota::BiStream](#) and [Dakota::BoStream](#) classes).

The type of file is determined by one of the four file name extensions listed below:

- **.H** A class header file ends in the suffix .H. The header file provides the class declaration. This file does not contain code for implementing the methods, except for the case of inline functions. Inline functions are to be placed at the bottom of the file with the keyword `inline` preceding the function name.
- **.C** A class implementation file ends in the suffix .C. An implementation file contains the definitions of the members of the class.
- **.h** A header file ends in the suffix .h. The header file contains information usually associated with procedures. Defined constants, data structures and function prototypes are typical elements of this file.
- **.c** A procedure file ends in the suffix .c. The procedure file contains the actual procedures.

Chapter 6

Class Documentation Conventions

Class documentation uses the doxygen tool available from <http://www.doxygen.org> and employs the JAVA-doc comment style. Brief comments appear in header files next to the attribute or function declaration. Detailed descriptions for functions should appear alongside their implementations (i.e., in the .C files for non-inlined, or in the headers next to the function definition for inlined). Detailed comments for a class or a class attribute must go in the header file as this is the only option.

NOTE: Previous class documentation utilities (class2frame and class2html) used the "://" comment style and comment blocks such as this:

```
//- Class:      Model
//- Description: The model to be iterated by the Iterator.
//-
//          Contains Variables, Interface, and Response objects.
//- Owner:      Mike Eldred
//- Version: $Id: Dev_Recomm_Pract.dox 4549 2007-09-20 18:25:03Z mseldre $
```

These tools are no longer used, so remaining comment blocks of this type are informational only and will not appear in the documentation generated by doxygen.

Chapter 7

CMake Style Guidelines

DAKOTA conventions for CMake files, such as CMakeLists.txt, FooConfig.cmake, etc., follow. Our goal is ease of reading, maintenance, and support, similar to the C++ code itself. Current CMake versions and build hints are maintained at the Developer Portal <http://dakota.sandia.gov/developer/>.

7.1 CMake Code Formatting

- Indentation is 2 spaces, consistent with DAKOTA C++ style.
- Lines should be kept to less than 80 chars per line where possible.
- Wrapped lines may be indented two spaces or aligned with prior lines.
- For ease of viewing and correctness checking in Emacs, a customization file is available: <http://www.cmake.org/CMakeDocs/cmake-mode.el>

7.2 CMake Variable Naming Conventions

These variable naming conventions are especially important for those that ultimately become preprocessor defines and affect compilation of source files.

- Classic/core elements of the CMake language are set in lower_case, e.g., option, set, if, find_library.
- Static arguments to CMake functions and macros are set in UPPER_CASE, e.g. REQUIRED, NO_MODULE, QUIET.
- Minimize "global" variables, i.e., don't use 2 variables with the same meaning when one will do the job.
- Feature toggling: when possible, use the "HAVE_<pkg/feature>" convention already in use by many CMake-enabled TPLs, e.g.,

```
$ grep HAVE_SYSTEM Dakota/src/CMakeLists.txt
check_function_exists(system HAVE_SYSTEM)
```

```
if(HAVE_SYSTEM)
    add_definitions("-DHAVE_SYSTEM")
endif(HAVE_SYSTEM)

$ grep HAVE_CONMIN Dakota/src/CMakeLists.txt Dakota/packages/CMakeLists.txt
Dakota/src/CMakeLists.txt:if(HAVE_CONMIN)
Dakota/src/CMakeLists.txt:endif(HAVE_CONMIN)
Dakota/packages/CMakeLists.txt:option(HAVE_CONMIN "Build the CONMIN package." ON)

Dakota/packages/CMakeLists.txt:if(HAVE_CONMIN)
Dakota/packages/CMakeLists.txt:endif(HAVE_CONMIN)
```

- When a variable/preprocessor macro could result in name clashes beyond DAKOTA scope, e.g., for library_mode users, consider prefixing the "HAVE_<pkg>" name with DAKOTA_, e.g. DAKOTA_HAVE_MPI. Currently, MPI is the only use case for such a variable in DAKOTA, but many examples can be found in the CMake Modules source, e.g.

```
grep _HAVE_ <cmake_prefix_dir>/share/cmake-2.8/Modules/*
```

Chapter 8

Instructions for Modifying DAKOTA's Input Specification

To modify DAKOTA's input specification (for maintenance or addition of new input syntax), specification maintenance mode must be enabled at DAKOTA configure time with the `--enable-spec-maint` option, e.g.,

```
./configure --enable-spec-maint
```

This will enable regeneration of NIDR and DAKOTA components which must be updated following a spec change.

Chapter 9

Modify `dakota.input.nspec`

The master input specification `dakota.input.nspec` in Dakota/src is the primary file to update when making a specification change. It uses the following syntactic elements:

- () for required group specifications
- [] for optional specifications
- | for alternatives
- {} for functions to process keywords to express logical relationships. These syntactic elements can be used to express various dependency relationships in the input specification. It is recommended that you review the existing specification and have an understanding of the constructs in use before attempting to add new ones.

Warning:

- Do *not* skip this step. Attempts to modify the NIDR_keywds.H file in Dakota/src without using the NIDR table generator are very error-prone. Moreover, the input specification provides a reference to the allowable inputs of a particular executable and should be kept in synch with the parser files; modifying the parser files independent of the input specification creates, at a minimum, undocumented features.
- All keywords in `dakota.input.nspec` are lower case by convention. All user inputs are converted to lower case by the parser prior to keyword match testing, resulting in case insensitive parsing.
- Since the NIDR parser allows abbreviation of keywords, you *must* avoid adding a keyword that could be misinterpreted as an abbreviation for a different keyword within the same top-level keyword, such as "strategy" and "method". For example, adding the keyword "expansion" within the method specification would be a mistake if the keyword "expansion_factor" already was being used in this specification.
- The NIDR input is somewhat order-dependent, allowing the same keyword to be reused multiple times in the specification. This often happens with aliases, such as `lower_bounds`, `upper_bounds` and `initial_point`. Ambiguities are resolved by attaching a keyword to the most recently seen context in which it could appear, if such exists, or to the first relevant context that subsequently comes along in the input file. With the earlier IDR parser, non-exclusive specifications (those not in mutually exclusive blocks) were required to be unique. That is why there are such aliases for `initial_point` as `cdv_initial_point` and `ddv_initial_point`: so older input files can be used with no or fewer changes.

Chapter 10

Rebuild generated files

As of DAKOTA 5.1, a separate make command in packages/nidr is no longer necessary. When configured with --enable-spec-maint, performing a make in Dakota/src will regenerate all files which derive from dakota.input.nspec, including NIDR_keywds.H, **dakota.input.summary**, NIDR_guikywd.H, and dakota.input.desc. If you commit changes to a source repository, be sure to commit any automatically generated files in addition to any modified in the following steps. It is not strictly necessary to run make at this point in the sequence, and in fact may generate errors if necessary handlers aren't yet available. One may optionally

```
cd Dakota/src  
make nidr-files
```

to only rebuild generated dependencies of dakota.input.nspec.

Chapter 11

Update NIDRProblemDescDB.C in Dakota/src

Many keywords have data associated with them: an integer, a floating-point number, a string, or arrays of such entities. Data requirements are specified in dakota.input.nspec by the tokens INTEGER, REAL, STRING, INTEGERTLIST, REALLIST, STRINGLIST. (Some keywords have no associated data and hence no such token.) After each keyword and data token, the dakota.input.nspec file specifies functions that the NIDR parser should call to record the appearance of the keyword and deal with any associated data. The general form of this specification is

```
{ startfcn, startdata, stopfcn, stopdata }
```

i.e., a brace-enclosed list of one to four functions and data pointers, with trailing entities taken to be zero if not present; zero for a function means no function will be called. The startfcn must deal with any associated data. Otherwise, the distinction between startfcn and stopfcn is relevant only to keywords that begin a group of keywords (enclosed in parentheses or square brackets). The startfcn is called before other entities in the group are processed, and the stop function is called after they are processed. Top-level keywords often have both startfcn and stopfcn; stopfcn is uncommon but possible for lower-level keywords. The startdata and (if needed) stopdata values are usually pointers to little structures that provide keyword-specific details to generic functions for startfcn and stopfcn. Some keywords that begin groups (such as "approx_problem" within the top-level "strategy" keyword) have no need of either a startfcn or a stopfcn; this is indicated by "{0}".

Most of the things within braces in dakota.input.nspec are invocations of macros defined in NIDRProblemDescDB.C. The macros simplify writing dakota.input.nspec and make it more readable. Most macro invocations refer to little structures defined in NIDRProblemDescDB.C, usually with the help of other macros, some of which have different definitions in different parts of NIDRProblemDescDB.C. When adding a keyword to dakota.input.nspec, you may need to add a structure definition or even introduce a new data type. NIDRProblemDescDB.C has sections corresponding to each top-level keyword. The top-level keywords are in alphabetical order, and most entities in the section for a top-level keyword are also in alphabetical order. While not required, it is probably good practice to maintain this structure, as it makes things easier to find.

Any integer, real, or string data associated with a keyword are provided to the keyword's startfcn, whose second argument is a pointer to a `Values` structure, defined in header file `nidr.h`.

Example 1: if you added the specification:

```
[method_setting REAL {method_setting_start, &method_setting_details} ]
```

you would provide a function

```
void NIDRProblemDescDB::  
method_setting_start(const char *keyname, Values *val, void **g, void *v)  
{ ... }
```

in NIDRProblemDescDB.C. In this example, argument &method_setting_details would be passed as v, val->n (the number of values) would be 1 and *val->r would be the REAL value given for the method_setting keyword. The method_setting_start function would suitably store this value with the help of method_setting_details.

For some top-level keywords, g (the third argument to the startfcn and stopfcn) provides access to a relevant context. For example, method_start (the startfcn for the top-level method keyword) executes

```
DataMethod *dm = new DataMethod;  
*g = (void*)dm;
```

(and supplies a couple of default values to dm). The start functions for lower-level keywords within the method keyword get access to dm through their g arguments. Here is an example:

```
void NIDRProblemDescDB::  
method_str(const char *keyname, Values *val, void **g, void *v)  
{  
    (* (DataMethod**)g)->**(String DataMethod::**)v = *val->s;  
}
```

In this example, v points to a pointer-to-member, and an assignment is made to one of the components of the [DataMethod](#) object pointed to by *g. The corresponding stopfcn for the top-level method keyword is

```
void NIDRProblemDescDB::  
method_stop(const char *keyname, Values *val, void **g, void *v)  
{  
    DataMethod *p = *(DataMethod**)g;  
    pDBBInstance->dataMethodList.insert(*p);  
    delete p;  
}
```

which copies the now populated [DataMethod](#) object to the right place and cleans up.

Example 2: if you added the specification

```
[method_setting REALLIST { {N_mdm(RealL,methodCoeffs) } }
```

then method_RealL (defined in NIDRProblemDescDB.C) would be called as the startfcn, and methodCoeffs would be the name of a (currently nonexistent) component of [DataMethod](#). The N_mdm macro is defined in NIDRProblemDescDB.C; among other things, it turns RealL into NIDRProblemDescDB::method_RealL. This function is used to process lists of REAL values for several keywords. By looking at the source, you can see that the list values are val->r[i] for 0 <= i < val->n.

Chapter 12

Update ProblemDescDB.C in Dakota/src

12.1 Augment/update get_<data_type>() functions

The next update step involves extending the database retrieval functions in ProblemDescDB.C. These retrieval functions accept an identifier string and return a database attribute of a particular type, e.g., a RealVector:

```
const RealVector& get_rdv(const String& entry_name);
```

The implementation of each of these functions contains tables of possible entry_name values and associated pointer-to-member values. There is one table for each relevant top-level keyword, with the top-level keyword omitted from the names in the table. Since binary search is used to look for names in these tables, each table must be kept in alphabetical order of its entry names. For example,

```
...
else if ((L = Begins(entry_name, "model."))) {
    if (dbRep->methodDBLocked)
        Locked_db();

#define P &DataModelRep::
static KW<RealVector, DataModelRep> RVdmo[] = {      // must be sorted
    {"nested.primary_response_mapping", P primaryRespCoeffs},
    {"nested.secondary_response_mapping", P secondaryRespCoeffs},
    {"surrogate.kriging_conmin_seed", P krigingConminSeed},
    {"surrogate.kriging_correlations", P krigingCorrelations},
    {"surrogate.kriging_max_correlations", P krigingMaxCorrelations},
    {"surrogate.kriging_min_correlations", P krigingMinCorrelations}};
#undef P

KW<RealVector, DataModelRep> *kw;
if ((kw = (KW<RealVector, DataModelRep>*)Binsearch(RVdmo, L)))
    return dbRep->dataModelIter->dataModelRep->*kw->p;
}
```

is the "model" portion of [ProblemDescDB::get_rdv\(\)](#). Based on entry_name, it returns the relevant attribute from a [DataModel](#) object. Since there may be multiple model specifications, the dataModelIter list iterator identifies which node in the list of [DataModel](#) objects is used. In particular, dataModelList contains a list of all of the data_model objects, one for each time a top-level model keyword was seen by the parser. The particular model object used for the data retrieval is managed by dataModelIter, which is set in a set_db_list_nodes() operation that will not be described here.

There may be multiple [DataMethod](#), [DataModel](#), [DataVariables](#), [DataInterface](#), and/or [DataResponses](#) objects. However, only one strategy specification is currently allowed so a list of [DataStrategy](#) objects is not needed. Rather, [ProblemDescDB::strategySpec](#) is the lone [DataStrategy](#) object.

To augment the `get_<data_type>()` functions, add table entries with new identifier strings and pointer-to-member values that address the appropriate data attributes from the Data class object. The style for the identifier strings is a top-down hierarchical description, with specification levels separated by periods and words separated with underscores, e.g., "keyword.group_specification.individual_specification". Use the `dbRep->listIter->attribute` syntax for variables, interface, responses, and method specifications. For example, the `method_setting` example attribute would be added to `get_drv()` as:

```
{"method_name.method_setting", P methodSetting},
```

inserted at the beginning of the `RVdmo` array shown above (since the name in the existing first entry, i.e., "nested.primary_response_mapping", comes alphabetically after "method_name.method_setting").

Chapter 13

Update Corresponding Data Classes

In this step, we extend the Data class definitions ([DataStrategy](#), [DataMethod](#), [DataModel](#), [DataVariables](#), [DataInterface](#), and/or [DataResponses](#)) to include the new attributes referenced in [Update NIDRProblemDescDB.C](#) in [Dakota/src](#) and [Augment/update get_<data_type>\(\)](#) functions.

13.1 Update the Data class header file

Add a new attribute to the public data for each of the new specifications. Follow the style guide for class attribute naming conventions (or mimic the existing code).

13.2 Update the .C file

Define defaults for the new attributes in the constructor initialization list. Add the new attributes to the assign() function for use by the copy constructor and assignment operator. Add the new attributes to the write(MPIPackBuffer&), read(MPIUnpackBuffer&), and write(ostream&) functions, paying careful attention to the use of a consistent ordering.

Chapter 14

Use `get_<data_type>()` Functions

At this point, the new specifications have been mapped through all of the database classes. The only remaining step is to retrieve the new data within the constructors of the classes that need it. This is done by invoking the `get_<data_type>()` function on the [ProblemDescDB](#) object using the identifier string you selected in [Augment/update get_<data_type>\(\) functions](#). For example:

```
const String& interface_type = problem_db.get_string("interface.type");
```

passes the "interface.type" identifier string to the [ProblemDescDB::get_string\(\)](#) retrieval function, which returns the desired attribute from the active [DataInterface](#) object.

Warning:

Use of the `get_<data_type>()` functions is restricted to class constructors, since only in class constructors are the data list iterators (i.e., `dataMethodIter`, `dataModelIter`, `dataVariablesIter`, `dataInterfaceIter`, and `dataResponsesIter`) guaranteed to be set correctly. Outside of the constructors, the database list nodes will correspond to the last set operation, and may not return data from the desired list node.

Chapter 15

Update the Documentation

Doxygen comments should be added to the Data class headers for the new attributes, and the reference manual sections describing the portions of dakota.input.nspec that have been modified should be updated. In particular, the reference manual tables summarizing keywords provide help data to the Jaguar user interface so need to be kept updated.

Chapter 16

Understanding Iterator Flow

This page explains the various phases comprising `Iterator::run_iterator()`. Prior to `Iterator` construction, when command-line options are parsed, Boolean run mode flags corresponding to PRERUN, RUN, and POSTRUN are set in `ParallelLibrary`. If the user didn't specify any specific run modes, the default is for all three to be true (all phases will execute).

`Iterator` is constructed.

When called, `run_iterator()` sequences:

- `initialize_run()`: unconditionally called, virtual. Performs common initialization such as allocating workspaces, setting communicators and evaluation counts. When re-implementing this virtual, a derived class must call its nearest parent's `initialize_run()`, typically *before* performing its own implementation steps.
- *Not implemented: pre-run input*
- IF PRERUN, invoke `pre_run()`: virtual function; default no-op. Purpose: derived classes should implement `pre_run()` if they are able to generate all parameter sets (variables) at once, separate from `run()`. Derived implementations should call their nearest parent's `pre_run()`, typically *before* performing their own steps.
- IF PRERUN, invoke `pre_output()`: non-virtual function; if user requested, output variables to file.
- *Not implemented: run input*
- IF RUN, invoke virtual function `run()`. Purpose: at a minimum, evaluate parameter sets through computing responses; for iterators without pre/post capability, their entire implementation is in `run()` and this is a reasonable default for new Iterators.
- *Not implemented: run output*
- IF POSTRUN, invoke `post_input()`: virtual function, default only print helpful message on mode. Purpose: derived iterators supporting post-run input from file must implement to read file and populate variables/responses (and possibly best points) appropriately. Implementations must check if the user requested file input.

- IF POSTRUN, invoke `post_run()`: virtual function. Purpose: generate statistics / final results. Any analysis that can be done solely on tabular data read by `post_input()` can be done here. Derived re-implementations should call their nearest parent's `post-run()`, typically *after* performing their specific post-run activities.
- *Not implemented: post-run output*
- `finalize_run()`: unconditionally called, virtual. Purpose: free workspaces. Default base class behavior is no-op, however, derived implementations should call their nearest parent's `finalize_run` *after* performing their specialized portions.

[Iterator](#) is destructed.

Chapter 17

Interfacing with DAKOTA as a Library

Chapter 18

Introduction

It is possible to link the DAKOTA toolkit into another application for use as an algorithm library. This section describes facilities which permit this type of integration.

As part of the normal DAKOTA build process, where `Dakota/configure --prefix=PREFIX` has been run prior to `make` and `make install`, a `libdakota.a` is created and a copy of it is placed in `PREFIX/lib` (`PREFIX` defaults to `/usr/local/Dakota`). This library contains all source files from `Dakota/src` excepting the `main.C`, `restart_util.C`, and `library_mode.C` main programs. This library may be linked with another application through inclusion of `-ldakota` on the link line. Library and header paths may also be specified using the `-L` and `-I` compiler options (using `PREFIX/lib` and `PREFIX/include`, respectively). Depending on the configuration used when building this library, other libraries for the vendor optimizers and vendor packages will also be needed to resolve DAKOTA symbols for DOT, NPSOL, OPT++, NCSUOpt, LHS, Teuchos, etc. Copies of these libraries are also placed in `Dakota/lib`. Refer to [Linking against the DAKOTA library](#) for additional information.

Warning:

Users may interface to DAKOTA as a library within other software applications provided that they abide by the terms of the GNU Lesser General Public License (LGPL). Refer to <http://www.gnu.org/licenses/lgpl.html> or contact the DAKOTA team for additional information.

Attention:

The use of DAKOTA as an algorithm library should be distinguished from the linking of simulations within DAKOTA using the direct application interface (see [DirectApplicInterface](#)). In the former, DAKOTA is providing algorithm services to another software application, and in the latter, a linked simulation is providing analysis services to DAKOTA. It is not uncommon for these two capabilities to be used in combination, where a simulation framework provides both the "front end" and the "back end" for DAKOTA.

Chapter 19

Quick start: examples and test code

To learn by example, refer to the files `PluginSerialDirectApplicInterface.[CH]` and `PluginParallelDirectApplicInterface.[CH]` in Dakota/src for simple examples of serial and parallel plug-in interfaces. The file [`library_mode.C`](#) in Dakota/src provides example usage of these plug-ins within a mock simulator program that demonstrates the required object instantiation syntax in combination with the three problem database population approaches (input file parsing, data node insertion, and mixed mode). All of this code may be compiled and tested by configuring DAKOTA using the `--with-plugin` option.

Chapter 20

Comparison to main.C

The procedure for utilizing DAKOTA as a library within another application involves a number of steps that are similar to those used in the stand-alone DAKOTA application. The stand-alone procedure can be viewed in the file [main.C](#), and the differences for the library approach are most easily explained with reference to that file. The basic steps of executing DAKOTA include instantiating the [ParallelLibrary](#), [CommandLineHandler](#), and [ProblemDescDB](#) objects; managing the DAKOTA input file ([ProblemDescDB::manage_inputs\(\)](#)); specifying restart files and output streams ([ParallelLibrary::specify_outputs_restart\(\)](#)); and instantiating the [Strategy](#) and running it ([Strategy::run_strategy\(\)](#)). When using DAKOTA as an algorithm library, the operations are quite similar, although command line information (argc, argv, and therefore [CommandLineHandler](#)) will not in general be accessible. In particular, [main.C](#) can pass argc and argv into the [ParallelLibrary](#) and [CommandLineHandler](#) constructors and then pass the [CommandLineHandler](#) object into [ProblemDescDB::manage_inputs\(\)](#) and [ParallelLibrary::specify_outputs_restart\(\)](#). In an algorithm library approach, a [CommandLineHandler](#) object is not instantiated and overloaded forms of the [ParallelLibrary](#) constructor, [ProblemDescDB::manage_inputs\(\)](#), and [ParallelLibrary::specify_outputs_restart\(\)](#) are used.

The overloaded forms of these functions are as follows. For instantiation of the [ParallelLibrary](#) object, the default constructor may be used. This constructor assumes that MPI is administered by the parent application such that the MPI configuration will be detected rather than explicitly created (i.e., DAKOTA will not call `MPI_Init` or `MPI_Finalize`). In code, the instantiation

```
ParallelLibrary parallel_lib(argc, argv);
```

is replaced with

```
ParallelLibrary parallel_lib;
```

In the case of specifying restart files and output streams, the call to

```
parallel_lib.specify_outputs_restart(cmd_line_handler);
```

should be replaced with its overloaded form in order to pass the required information through the parameter list

```
parallel_lib.specify_outputs_restart(std_output_filename, std_error_filename,  
read_restart_filename, write_restart_filename, stop_restart_evals);
```

where file names for standard output and error and restart read and write as well as the integer number of restart evaluations are passed through the parameter list rather than read from the command line of the main DAKOTA

program. The definition of these attributes is performed elsewhere in the parent application (e.g., specified in the parent application input file or GUI). In this function call, specify NULL for any files not in use, which will elicit the desired subset of the following defaults: standard output and standard error are directed to the terminal, no restart input, and restart output to file `dakota.rst`. The `stop_restart_evals` specification is an optional parameter with a default of 0, which indicates that restart processing should process all records. If no overrides of these defaults are intended, the call to `specify_outputs_restart()` may be omitted entirely.

With respect to alternate forms of [ProblemDescDB::manage_inputs\(\)](#), the following section describes different approaches to populating data within DAKOTA's problem description database. It is this database from which all DAKOTA objects draw data upon instantiation.

Chapter 21

Problem database population

Now that the [ProblemDescDB](#) object has been instantiated, we must populate it with data, either via parsing an input file, direct data insertion, or a mixed approach, as described in the following sections.

21.1 Input file parsing

The simplest approach to linking an application with the DAKOTA library is to rely on DAKOTA's normal parsing system to populate DAKOTA's problem database ([ProblemDescDB](#)) through the reading of an input file. The disadvantage to this approach is the requirement for an additional input file beyond those already required by the parent application.

In this approach, the [main.C](#) call to

```
problem_db.manage_inputs(cmd_line_handler);
```

would be replaced with its overloaded form

```
problem_db.manage_inputs(dakota_input_file);
```

where the file name for the DAKOTA input is passed through the parameter list rather than read from the command line of the main DAKOTA program. Again, the definition of the DAKOTA input file name is performed elsewhere in the parent application (e.g., specified in the parent application input file or GUI). Refer to [run_dakota_parse\(\)](#) in [library_mode.C](#) for a complete example listing.

[ProblemDescDB::manage_inputs\(\)](#) invokes [ProblemDescDB::parse_inputs\(\)](#) (which in turn invokes [ProblemDescDB::check_input\(\)](#), [ProblemDescDB::broadcast\(\)](#), and [ProblemDescDB::post_process\(\)](#)), which are lower level functions that will be important in the following two sections. Thus, the input file parsing approach may employ a single coarse grain function to coordinate all aspects of problem database population, whereas the two approaches to follow will use lower level functions to accomplish a finer grain of control.

21.2 Data node insertion

This approach is more involved than the previous approach, but it allows the application to publish all needed data to DAKOTA's database directly, thereby eliminating the need for the parsing of a separate DAKOTA input file.

In this case, `ProblemDescDB::manage_inputs()` is not called. Rather, `DataStrategy`, `DataMethod`, `DataModel`, `DataVariables`, `DataInterface`, and `DataResponses` objects are instantiated and populated with the desired problem data. These objects are then published to the problem database using `ProblemDescDB::insert_node()`, e.g.:

```
// instantiate the data object
DataMethod data_method;

// set the attributes within the data object
data_method.methodName = "nond_sampling";
...

// publish the data object to the ProblemDescDB
problem_db.insert_node(data_method);
```

The data objects are populated with their default values upon instantiation, so only the non-default values need to be specified. Refer to the `DataStrategy`, `DataMethod`, `DataModel`, `DataVariables`, `DataInterface`, and `DataResponses` class documentation and source code for lists of attributes and their defaults.

The default strategy is `single_method`, which runs a single iterator on a single model, and the default model is `single`, so it is not necessary to instantiate and publish a `DataStrategy` or `DataModel` object if advanced multi-component capabilities are not required. Rather, instantiation and insertion of a single `DataMethod`, `DataVariables`, `DataInterface`, and `DataResponses` object is sufficient for basic DAKOTA capabilities.

Once the data objects have been published to the `ProblemDescDB` object, calls to

```
problem_db.check_input();
problem_db.broadcast();
problem_db.post_process();
```

will perform basic database error checking, broadcast a packed MPI buffer of the specification data to other processors, and post-process specification data to fill in vector defaults (scalar defaults are handled in the Data class constructors), respectively. For parallel applications, processor rank 0 should be responsible for Data node population and insertion and the call to `ProblemDescDB::check_input()`, and all processors should participate in `ProblemDescDB::broadcast()` and `ProblemDescDB::post_process()`. Moreover, preserving the order shown assures that large default vectors are not transmitted by MPI. Refer to `run_dakota_data()` in `library_mode.C` for a complete example listing.

21.3 Mixed mode

In this case, we will combine the parsing of a DAKOTA input file with some direct database updates. The motivation for this approach arises in large-scale applications where large vectors can be awkward to specify in a DAKOTA input file. The first step is to parse the input file, but rather than using

```
problem_db.manage_inputs(dakota_input_file);
```

as described in [Input file parsing](#), we will use the lower level function

```
problem_db.parse_inputs(dakota_input_file);
```

to provide a finer grain of control. The passed input file `dakota_input_file` must contain all required inputs. Since vector data like variable values/bounds/tags, linear/nonlinear constraint coefficients/bounds, etc. are optional, these potentially large vector specifications can be omitted from the input file. Only the variable/response counts, e.g.:

```

method
    linear_inequality_constraints = 500

variables
    continuous_design = 1000

responses
    objective_functions = 1
    nonlinear_inequality_constraints = 100000

```

are required in this case. To update the data omissions from their defaults, one uses the [ProblemDescDB::set\(\)](#) family of overloaded functions, e.g.

```

Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized
    to 1.
problem_db.set("variables.continuous_design.initial_point", drv);

```

where the string identifiers are the same identifiers used when pulling information from the database using one of the `get_<datatype>()` functions (refer to the source code of `ProblemDescDB.C` for a full list). However, the supported [ProblemDescDB::set\(\)](#) options are a restricted subset of the database attributes, focused on vector inputs that can be large scale.

If performing these updates within the constructor of a [DirectApplicInterface](#) extension/derivation (see [Defining the direct application interface](#)), then this code is sufficient since the database is unlocked, the active list nodes of the `ProblemDescDB` have been set for you, and the correct strategy/method/model/variables/interface/responses specification instance will get updated. The difficulty in this case stems from the order of instantiation. Since the `Variables` and `Response` instances are constructed in the base `Model` class, prior to construction of `Interface` instances in derived `Model` classes, database information related to `Variables` and `Response` objects will have already been extracted by the time the `Interface` constructor is invoked and the database update will not propagate.

Therefore, it is preferred to perform these operations at a higher level (e.g., within your main program), prior to `Strategy` instantiation and execution, such that instantiation order is not an issue. However, in this case, it is necessary to explicitly manage the list nodes of the `ProblemDescDB` using a specification instance identifier that corresponds to an identifier from the input file, e.g.:

```

problem_db.set_db_variables_node("MY_VARIABLES_ID");
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized
    to 1.
problem_db.set("variables.continuous_design.initial_point", drv);

```

Alternatively, rather than setting just a single data node, all data nodes may be set using a method specification identifier:

```
problem_db.set_db_list_nodes("MY_METHOD_ID");
```

since the method specification is responsible for identifying a model specification, which in turn identifies variables, interface, and responses specifications. If hardwiring specification identifiers is undesirable, then

```
problem_db.resolve_top_method();
```

can also be used to deduce the active method specification and set all list nodes based on it. This is most appropriate in the case where only single specifications exist for method/model/variables/interface/responses. In each of these cases, setting list nodes unlocks the corresponding portions of the database, allowing set/get operations.

Once all direct database updates have been performed in this manner, calls to [ProblemDescDB::broadcast\(\)](#) and [ProblemDescDB::post_process\(\)](#) should be used on all processors. The former will broadcast a packed MPI

buffer with the aggregated set of specification data from rank 0 to other processors, and the latter will post-process specification data to fill in any vector defaults that have not yet been provided through either file parsing or direct updates (Note: scalar defaults are handled in the Data class constructors). Refer to [run_dakota_mixed\(\)](#) in [library_mode.C](#) for a complete example listing.

Chapter 22

Instantiating the strategy

With the [ProblemDescDB](#) object populated with problem data, we may now instantiate the strategy.

```
// instantiate the strategy
Strategy selected_strategy(problem_db);
```

Following strategy construction, all MPI communicator partitioning has been performed and the [ParallelLibrary](#) instance may be interrogated for parallel configuration data. For example, the lowest level communicators in DAKOTA's multilevel parallel partitioning are the analysis communicators, which can be retrieved using:

```
// retrieve the set of analysis communicators for simulation initialization:
// one analysis comm per ParallelConfiguration (PC), one PC per Model.
Array<MPI_Comm> analysis_comms = parallel_lib.analysis_intra_communicators();
```

These communicators can then be used for initializing parallel simulation instances, where the number of MPI communicators in the array corresponds to one communicator per [ParallelConfiguration](#) instance.

Chapter 23

Defining the direct application interface

When employing a library interface to DAKOTA, it is frequently desirable to also use a direct interface between DAKOTA and the simulation. There are two approaches to defining this direct interface.

23.1 Extension

The first approach involves extending the existing `DirectApplicInterface` class to support additional direct simulation interfaces. In this case, a new simulation interface function can be added to `Dakota/src/DirectApplicInterface.[CH]` for the simulation of interest. If the new function will not be a member function, then the following prototype should be used in order to pass the required data:

```
int sim(const Dakota::Variables& vars, const Dakota::ActiveSet& set,  
        Dakota::Response& response);
```

If the new function will be a member function, then this can be simplified to

```
int sim();
```

since the data access can be performed through the `DirectApplicInterface` class attributes.

This simulation can then be added to the logic blocks in `DirectApplicInterface::derived_map_ac()`. In addition, `DirectApplicInterface::derived_map_if()` and `DirectApplicInterface::derived_map_of()` can be extended to perform pre- and post-processing tasks if desired, but this is not required.

While this approach is the simplest, it has the disadvantage that the DAKOTA library may need to be recompiled when the simulation or its direct interface is modified. If it is desirable to maintain the independence of the DAKOTA library from the host application, then the following derivation approach should be employed.

23.2 Derivation

The second approach is to derive a new interface from `DirectApplicInterface` in order to redefine several virtual functions. A typical derived class declaration might be

```
namespace SIM {
```

```

class SerialDirectApplicInterface: public Dakota::DirectApplicInterface
{
public:
    // Constructor and destructor

    SerialDirectApplicInterface(const Dakota::ProblemDescDB& problem_db);
    ~SerialDirectApplicInterface();

protected:
    // Virtual function redefinitions

    int derived_map_if(const Dakota::String& if_name);
    int derived_map_ac(const Dakota::String& ac_name);
    int derived_map_of(const Dakota::String& of_name);

private:
    // Data
}

} // namespace SIM

```

where the new derived class resides in the simulation's namespace. Similar to the case of [Extension](#), the `DirectApplicInterface::derived_map_ac()` function is the required redefinition, and `DirectApplicInterface::derived_map_if()` and `DirectApplicInterface::derived_map_of()` are optional.

The new derived interface object (from namespace [SIM](#)) must now be plugged into the strategy. In the simplest case of a single model and interface, one could use

```

// retrieve the interface of interest
ModelList& all_models = problem_db.model_list();
Model& first_model = *all_models.begin();
Interface& interface = first_model.interface();
// plug in the new direct interface instance (DB does not need to be set)
interface.assign_rep(new SIM::SerialDirectApplicInterface(problem_db), false);

```

from within the [Dakota](#) namespace. In a more advanced case of multiple models and multiple interface plug-ins, one might use

```

// retrieve the list of Models from the Strategy
ModelList& models = problem_db.model_list();
// iterate over the Model list
for (ModelListIter ml_iter = models.begin(); ml_iter != models.end(); ml_iter++) {

    Interface& interface = ml_iter->interface();
    if (interface.interface_type() == "direct" &&
        interface.analysis_drivers().contains("SIM") ) {
        // set the correct list nodes within the DB prior to new instantiations
        problem_db.set_db_model_nodes(ml_iter->model_id());
        // plug in the new direct interface instance
        interface.assign_rep(new SIM::SerialDirectApplicInterface(problem_db), false);
    }
}

```

In the case where the simulation interface instance should manage parallel simulations within the context of an MPI communicator, one should pass in the relevant analysis communicator(s) to the derived constructor. For the

latter case of looping over a set of models, the simplest approach of passing a single analysis communicator would use code similar to

```
const ParallelLevel& ea_level =
    ml_iter->parallel_configuration_iterator()->ea_parallel_level();
const MPI_Comm& analysis_comm = ea_level.server_intra_communicator();
interface.assign_rep(new SIM::ParallelDirectApplicInterface(problem_db, analysis
    s_comm),
    false);
```

Since Models may be used in multiple parallel contexts and may therefore have a set of parallel configurations, a more general approach would extract and pass an array of analysis communicators to allow initialization for each of the parallel configurations.

New derived direct interface instances inherit various attributes of use in configuring the simulation. In particular, the [ApplicationInterface::parallelLib](#) reference provides access to MPI communicator data (e.g., the analysis communicators discussed in [Instantiating the strategy](#)), [DirectApplicInterface::analysisDrivers](#) provides the analysis driver names specified by the user in the input file, and [DirectApplicInterface::analysisComponents](#) provides additional analysis component identifiers (such as mesh file names) provided by the user which can be used to distinguish different instances of the same simulation interface. It is worth noting that inherited attributes that are set as part of the parallel configuration (instead of being extracted from the [ProblemDescDB](#)) will be set to their defaults following construction of the base class instance for the derived class plug-in. It is not until run-time (i.e., within `derived_map_if/derived_map_ac/derived_map_of`) that the parallel configuration settings are re-propagated to the plug-in instance. This is the reason that the analysis communicator should be passed in to the constructor of a parallel plug-in, if the constructor will be responsible for parallel application initialization.

Chapter 24

Additional updates

As part of strategy instantiation, all problem specification data is extracted from [ProblemDescDB](#) as various objects are constructed. Therefore, any updates that need to be performed following strategy instantiation must be performed through direct set operations on the constructed objects. In the previous section, the process for updating the [Interface](#) object used within a [Model](#) was shown. To update other data such as variable values/bounds/tags or response bounds/targets/tags, refer to the set functions documented in [Iterator](#) and [Model](#). As an example, the following code updates the active continuous variable values, which will be employed as the initial guess for certain classes of Iterators:

```
ModelList& all_models = problem_db.model_list();
Model& first_model = *all_models.begin();
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized
                                to 1.
first_model.continuous_variables(drv);
```

Chapter 25

Executing the strategy

Finally, with simulation configuration and plug-ins completed, we execute the strategy:

```
// run the strategy  
selected_strategy.run_strategy();
```

Chapter 26

Retrieving data after a run

After executing the strategy, final results can be obtained through the use of [Strategy::variables_results\(\)](#) and [Strategy::response_results\(\)](#), e.g.:

```
// retrieve the final parameter values
const Variables& vars = selected_strategy.variables_results();

// retrieve the final response values
const Response& resp = selected_strategy.response_results();
```

In the case of optimization, the final design is returned, and in the case of uncertainty quantification, the final statistics are returned.

Chapter 27

Linking against the DAKOTA library

This section presumes DAKOTA has been compiled with configure/make and installed to `PREFIX` using 'make install'. While the DAKOTA build system offers the most up-to-date guidance for what libraries are needed to link against a particular version of DAKOTA, a typical case is presented here. Note that depending on how you configured DAKOTA, some of the following libraries may not be available (for example NPSOL, DOT, NLPQL) -- check which appear in `$PREFIX/lib`.

As of DAKOTA 5.0, `-levidence` is no longer required and `-lgs1` is optional (discouraged due to GPL), depending on how DAKOTA was configured.

Post DAKOTA 5.0, `-lquadrature` has been renamed to `-lsparsegrid`. Also the DFFTPACK library should be integrated into libpecos, so `-ldfftpack` should not be needed and NKM should be integrated into libsurfpack, so `-lnkm` should not be needed.

Note that as of DAKOTA 5.2, `-lnewmat` is no longer required but additional Boost libraries are needed (`-lboost_regex -lboost_filesystem -lboost_system`) as a result of migration from legacy DAKOTA utilities to more modern Boost components. It should also be noted that DAKOTA relies on VERSION 2 of Boost.Filesystem which is provided in the source distribution under packages/boost (Boost.Filesystem VERSION 3 is NOT supported at this time).

```
DAKOTA_LIBS = -L${PREFIX}/lib -ldakota -lteuchos -lpecos -llhs \
              -lsparsegrid -lsurfpack -lcommn -lddace -ldot -lfsudace \
              -ljega -lcport -lnlpql -lnpsol -loptpp -lpsuade \
              -lncsuopt -lcolin -linterfaces -lmomh -lscolib -lpebbl \
              -ltinyxml -lutilib -l3po -lhopsack -lnindr -lampsolver \
              -lboost_signals -lboost_regex -lboost_filesystem \
              -lboost_system -llapack -lblas
```

You may also need `funcadd0.o`, `-lfl`, `-lexpat`, and, if linking with system-provided GSL, `-lgslcblas`. The AMPL solver library may require `-ldl`. System compiler and math libraries may also need to be included. If configuring with graphics, you will need to add `-lDGraphics` and system X libraries (partial list here):

```
-lxpm -lxm -lxxt -lxmu -lxp -lxext -lx11 -lsm -lICE
```

CMake support for library users is experimental. At present library names and inclusion requirements differ slightly when using CMake, e.g. `libpecos_src` and `libdakota_src` instead of `libpecos` and `libdakota`, respectively. A representative (non-authoritative) set of necessary link libraries is shown here for illustration purposes only:

```
-ldakota_src -lteuchos -lnindr -lpecos -lpecos_src -llhs -lmods -lmod
```

```
-ldfftpack -lparsegrid -lsurfpack -lsurfpack -lutilib -lcolin -linterfaces  
-lscolib -l3po -lpebbl -ltinyxml -lcommn -ldace -lanalyzer -lrandom  
-lsampling -lbose -ldot -lfsudace -lhopspack -ljega -ljega_fe -lmoga  
-lsoga -leutils -lutilities -lncsuopt -lnlpql -lcport -lnpsol -loptpp  
-lpsuade -lDGraphics -lamplsolver -lboost_regex -lboost_signals  
-lboost_filesystem -lboost_system -lSM -lICE -lX11 -lXext -lXm -lXpm  
-lXmu -lpthread -llapack -lcurl -ldl -lutilib -ltinyxml -lm -lboost_regex  
-lboost_filesystem -lboost_system -lexpat -lboost_signals -ljega -lteuchos  
-lblas -llapack
```

We have experienced problems with the creation of `libamplsolver.a` on some platforms. Please use the DAKOTA mailing lists for help with any problems.

Finally, it is important to use the same C++ compiler (possibly an MPI wrapper) for compiling DAKOTA and your application and declare the compiler define `-DHAVE_CONFIG_H` when including header files from DAKOTA. This ensures that the platform configuration settings are properly propagated.

Chapter 28

Summary

To utilize the DAKOTA library within a parent software application, the basic steps of [main.C](#) and the order of invocation of these steps should be mimicked from within the parent application. Of these steps, [ParallelLibrary](#) instantiation, [ProblemDescDB::manage_inputs\(\)](#) and [ParallelLibrary::specify_outputs_restart\(\)](#) require the use of overloaded forms in order to function in an environment without direct command line access and, potentially, without file parsing. Additional optional steps not performed in [main.C](#) include the extension/derivation of the direct interface and the retrieval of strategy results after a run.

DAKOTA's library mode is now in production use within several Sandia and external simulation codes/frameworks.

Chapter 29

Performing Function Evaluations

Performing function evaluations is one of the most critical functions of the DAKOTA software. It can also be one of the most complicated, as a variety of scheduling approaches and parallelism levels are supported. This complexity manifests itself in the code through a series of cascaded member functions, from the top level model evaluation functions, through various scheduling routines, to the low level details of performing a system call, fork, or direct function invocation. This section provides an overview of the primary classes and member functions involved.

Chapter 30

Synchronous function evaluations

For a synchronous (i.e., blocking) mapping of parameters to responses, an iterator invokes `Model::compute_response()` to perform a function evaluation. This function is all that is seen from the iterator level, as underlying complexities are isolated. The binding of this top level function with lower level functions is as follows:

- `Model::compute_response()` utilizes `Model::derived_compute_response()` for portions of the response computation specific to derived model classes.
- `Model::derived_compute_response()` directly or indirectly invokes `Interface::map()`.
- `Interface::map()` utilizes `ApplicationInterface::derived_map()` for portions of the mapping specific to derived application interface classes.

Chapter 31

Asynchronous function evaluations

For an asynchronous (i.e., nonblocking) mapping of parameters to responses, an iterator invokes [Model::asynch_compute_response\(\)](#) multiple times to queue asynchronous jobs and then invokes either [Model::synchronize\(\)](#) or [Model::synchronize_nowait\(\)](#) to schedule the queued jobs in blocking or nonblocking fashion. Again, these functions are all that is seen from the iterator level, as underlying complexities are isolated. The binding of these top level functions with lower level functions is as follows:

- [Model::asynch_compute_response\(\)](#) utilizes [Model::derived_asynch_compute_response\(\)](#) for portions of the response computation specific to derived model classes.
- This derived model class function directly or indirectly invokes [Interface::map\(\)](#) in asynchronous mode, which adds the job to a scheduling queue.
- [Model::synchronize\(\)](#) or [Model::synchronize_nowait\(\)](#) utilize [Model::derived_synchronize\(\)](#) or [Model::derived_synchronize_nowait\(\)](#) for portions of the scheduling process specific to derived model classes.
- These derived model class functions directly or indirectly invoke [Interface::synch\(\)](#) or [Interface::synch_nowait\(\)](#).
- For application interfaces, these interface synchronization functions are responsible for performing evaluation scheduling in one of the following modes:
 - asynchronous local mode (using [ApplicationInterface::asynchronous_local_evaluations\(\)](#) or [ApplicationInterface::asynchronous_local_evaluations_nowait\(\)](#))
 - message passing mode (using [ApplicationInterface::self_schedule_evaluations\(\)](#) or [ApplicationInterface::static_schedule_evaluations\(\)](#) on the iterator master and [ApplicationInterface::serve_evaluations_synch\(\)](#) or [ApplicationInterface::serve_evaluations_peer\(\)](#) on the servers)
 - hybrid mode (using [ApplicationInterface::self_schedule_evaluations\(\)](#) or [ApplicationInterface::static_schedule_evaluations\(\)](#) on the iterator master and [ApplicationInterface::serve_evaluations_asynch\(\)](#) on the servers)
- These scheduling functions utilize [ApplicationInterface::derived_map\(\)](#) and [ApplicationInterface::derived_map_asynch\(\)](#) for portions of asynchronous job launching specific to derived application interface classes, as well as [ApplicationInterface::derived_synch\(\)](#) and

[ApplicationInterface::derived_synch_nowait\(\)](#) for portions of job capturing specific to derived application interface classes.

Chapter 32

Analyses within each function evaluation

The discussion above covers the parallelism level of concurrent function evaluations serving an iterator. For the parallelism level of concurrent analyses serving a function evaluation, similar schedulers are involved ([ForkApplicInterface::synchronous_local_analyses\(\)](#), [ForkApplicInterface::asynchronous_local_analyses\(\)](#), [ApplicationInterface::self_schedule_analyses\(\)](#), [ApplicationInterface::serve_analyses_synch\(\)](#), [ForkApplicInterface::serve_analyses_asynch\(\)](#)) to support synchronous local, asynchronous local, message passing, and hybrid modes. Not all of the schedulers are elevated to the [ApplicationInterface](#) level since the system call and direct function interfaces do not yet support nonblocking local analyses (and therefore support synchronous local and message passing modes, but not asynchronous local or hybrid modes). Fork interfaces, however, support all modes of analysis parallelism.

Chapter 33

Working with Variable Containers and Views

Variable views control the subset of variable types that are active and inactive within a particular iterative study. For design optimization and uncertainty quantification (UQ), for example, the active variables view consists of design or uncertain types, respectively, and any other variable types are carried along invisible to the iterative algorithm being employed. For parameter studies and design of experiments, however, a variable subset view is not imposed and all variables are active. Selected UQ methods can also be toggled into an "All" view using the `all_variables` input specification. When not in an All view, finer gradations within the uncertain variable sets are also relevant: probabilistic methods (reliability, stochastic expansion) view aleatory uncertain variables as active, nonprobabilistic methods (interval, evidence) view epistemic uncertain variables as active, and a few UQ methods (sampling) view both as active. In a more advanced [NestedModel](#) use case such as optimization under uncertainty, design variables are active in the outer optimization context and the uncertain variables are active in the inner UQ context, with an additional requirement on the inner UQ level to return derivatives with respect to its "inactive" variables (i.e., the design variables) for use in the outer optimization loop.

For efficiency, contiguous arrays of data store variable information for each of the domain types (continuous, discrete integer, and discrete real), but active and inactive views into them permit selecting subsets in a given context. This management is encapsulated into the [Variables](#) and [SharedVariablesData](#) classes. This page clarifies concepts of merged vs. mixed, fine-grained vs. aggregated types, domain types, and views into contiguous arrays.

We begin with an overview of the storage and management concept, for which the following two sections describe the storage of variable values and meta-data about their organization, used in part to manage views. They are intended to communicate rationale to maintainers of [Variables](#) and [SharedVariablesData](#) classes. The final section provides a discussion of active and inactive views.

Chapter 34

Storage in Variables

As described in the [Main Page Variables](#), a `Variables` object manages variable types (design, aleatory uncertain, epistemic uncertain, and state) and domain types (continuous, discrete integer, and discrete real) and supports different approaches to either distinguishing among these types or aggregating them. Two techniques are used in cooperation to accomplish this management: (1) class specialization (`MergedVariables` or `MixedVariables`) and (2) views into contiguous variable arrays. The latter technique is used whenever it can satisfy the requirement, with fallback to class specialization when it cannot. In particular, aggregation or separation of variable types can be accomplished with views, but for aggregation or separation of variable domains, we must resort to class specialization in order to relax discrete domain types. In this class specialization, a `MergedVariables` object combines continuous and discrete types (relaxing integers to reals) whereas a `MixedVariables` object maintains the integer/real distinction throughout.

The core data for a `Variables` instance is stored in a set of three contiguous arrays, corresponding to the domain types: `allContinuousVars`, `allDiscreteIntVars`, and `allDiscreteRealVars`, unique to each `Variables` instance.

Within the core variable data arrays, data corresponding to different aggregated variable types are stored in sequence for each domain type:

- continuous: [design, aleatory uncertain, epistemic uncertain, state]
- discrete integer: [design, aleatory uncertain, (epistemic uncertain), state]
- discrete real: [design, aleatory uncertain, (epistemic uncertain), state]

Note there are currently no epistemic discrete variables. This domain type ordering (continuous, discrete integer, discrete real) and aggregated variable type ordering (design, aleatory uncertain, epistemic uncertain, state) is preserved whenever distinct types are flattened into single contiguous arrays. Note that the aleatory and epistemic uncertain variables contain sub-types for different distributions (e.g., normal, uniform, histogram, poisson), and discrete integer types include both integer ranges and integer set sub-types. All sub-types are ordered according to their order of appearance in `dakota.input.nspec`.

When relaxing in `MixedVariables`, the `allContinuousVars` will also aggregate the discrete types, such that they contain ALL design, then ALL uncertain, then ALL state variables, each in aggregated type order; the `allDiscreteIntVars` and `allDiscreteRealVars` arrays are empty.

Chapter 35

Storage in SharedVariablesData

Each [Variables](#) instance contains a reference-counted [SharedVariablesData](#) object that stores information on the variables configuration. This configuration data includes counts, types, IDs, and labels, which are often the same across many [Variables](#) instances. Thus, [SharedVariablesData](#) is intended to reduce the memory footprint by allowing the sharing of a single copy of redundant information among different [Variables](#) instances.

One of the purposes of this shared information is to support mappings between variable types, IDs, and indices into the storage arrays. Variable "types" refer to the fine-grained variable types a user would specify in an input file, as enumerated in `DataVariables.H`, e.g, `CONTINUOUS_DESIGN`, `WEIBULL_UNCERTAIN`, `DISCRETE_STATE_RANGE`, etc. [variablesComponents](#) is a map from these variable types to counts of how many are present.

In contrast, the [variablesCompsTotals](#) array stores total counts of each "aggregated type" (design, aleatory uncertain, epistemic uncertain, state) which might be selected to be active in a given view. Thus this array has length 12 to track the combinations of three domain type storage arrays with four possible aggregated variable types: {continuous, discrete integer, discrete real} x {design, aleatory uncertain, epistemic uncertain, state}. For example, the first entry of this array stores the number of continuous design variables, the second the number of discrete integer design (including both discrete design range and discrete design set integer types), and the last the number of discrete real state variables.

The arrays [allContinuousTypes](#), [allDiscreteIntTypes](#), and [allDiscreteRealTypes](#) are sized to match the corresponding core domain type storage arrays. They track the fine-grained variable type stored in that entry of the data array (since when relaxed, the continuous array may be storing data corresponding to discrete data).

Finally [allContinuousIds](#) stores the 1-based IDs of the variables stored in the [allContinuousVars](#) array, i.e., the variable number of all the problem variables considered as a single contiguous set, in aggregate type order. For merged (relaxed) views, [mergedDiscreteIds](#) stores the 1-based IDs of the variables which have been relaxed into the continuous array.

These counts, types, and IDs are most commonly used within the [Model](#) classes for mappings between variables objects at different levels of a model recursion. See, for example, the variable mappings in the [NestedModel](#) constructor.

Chapter 36

Active and inactive views

The pair `SharedVariablesDataRep::variablesView` tracks the active and inactive views of the data, with values taken from the enum in `DataVariables.H`. The valid values include `EMPTY` and the combinations {merged, mixed} x {all, design, aleatory uncertain, epistemic uncertain, uncertain, state}. The `ALL` cases indicate aggregation of the design, aleatory uncertain, epistemic uncertain, and state types, whereas the `DISTINCT` cases indicate either no aggregation (design, aleatory uncertain, epistemic uncertain, state) or reduced aggregation (aleatory+epistemic uncertain). The active view is determined by the algorithm in use, managed in `Variables::get_view()`. Any inactive view is set based on higher level iteration within a model recursion (e.g., a `NestedModel`), which enables lower level iteration to return derivatives with respect to variables that are active at the higher level. In the case where there is no higher level iteration, then the inactive view will remain `EMPTY`. It is important to stress that "inactive" at one level corresponds to active at another, and therefore the inactive set of variables should not be interpreted as the strict complement of the active set of variables; rather, active and inactive are both subsets whose union may still be a subset of the total container (more precise terminology might involve "primary" active and "secondary" active or similar). An active complement view could potentially be supported in the future, should the need arise, although this view would require management of non-contiguous portions of the aggregated arrays.

Given these groupings (views), the active and inactive subsets of the `allContinuousVars`, `allDiscreteIntVars`, and `allDiscreteRealVars` arrays are always contiguous, permitting vector views of the underlying data using either `Teuchos::View` (for numerical vectors) or `Boost.MultiArray` (for book-keeping arrays) views.

When a `Variables` envelope is constructed, its letter is initialized to either a `MergedVariables` or `MixedVariables` object depending on the active view. The derived classes size the contiguous storage arrays to accomodate all the problem variables, and then initialize active views into them, which could involve either subsets (`DISTINCT` active views) or views of the full arrays (`ALL` active views). Inactive views, on the other hand, are initialized during construction of a model recursion (e.g., a call to `Model::inactive_view()` in the `NestedModel` constructor). Thus, active variable subsets are always available but inactive variable subsets will be `EMPTY` prior to them being initialized within a `Model` recursion.

Accessors for continuous variables include:

- `continuous_variables()`: returns the active view which might return all (`ALL` views) or a subset (`DISTINCT` views) such as design, uncertain, only aleatory uncertain, etc.
- `inactive_continuous_variables()`: returns the inactive view which is either a subset or empty
- `all_continuous_variables()`: returns the full vector `allContinuousVars`

and this pattern is followed for active/inactive/all access to discrete_int_variables() and discrete_real_variables() as well as for labels, IDs, and types in [SharedVariablesData](#) and variable bounds in [Constraints](#).

Chapter 40

Class Index

40.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

ActiveSet (Container class for active set tracking information. Contains the active set request vector and the derivative variables vector)	265
AnalysisCode (Base class providing common functionality for derived classes (SysCallAnalysisCode and ForkAnalysisCode) which spawn separate processes for managing simulations)	269
Analyzer (Base class for NonD , DACE, and ParamStudy branches of the iterator hierarchy)	274
ApplicationInterface (Derived class within the interface class hierarchy for supporting interfaces to simulation codes)	280
Approximation (Base class for the approximation class hierarchy)	294
ApproximationInterface (Derived class within the interface class hierarchy for supporting approximations to simulation-based results)	303
APPSEvalMgr (Evaluation manager class for APPSPACK)	309
APPSOptimizer (Wrapper class for APPSPACK)	312
BaseConstructor (Dummy struct for overloading letter-envelope constructors)	316
BiStream (The binary input stream class. Overloads the >> operator for all data types)	317
BoStream (The binary output stream class. Overloads the << operator for all data types)	320
COLINApplication	323
COLINOptimizer (Wrapper class for optimizers defined using COLIN)	327
CollaborativeHybridStrategy (Strategy for hybrid minimization using multiple collaborating optimization and nonlinear least squares methods)	332
CommandLineHandler (Utility class for managing command line inputs to DAKOTA)	334
CommandShell (Utility class which defines convenience operators for spawning processes with system calls)	336
ConcurrentStrategy (Strategy for multi-start iteration or pareto set optimization)	338
CONMINOptimizer (Wrapper class for the CONMIN optimization library)	341
Constraints (Base class for the variable constraints class hierarchy)	349
DataFitSurrModel (Derived model class within the surrogate model branch for managing data fit surrogates (global and local))	362
DataInterface (Handle class for interface specification data)	375
DataMethod (Handle class for method specification data)	377

DataMethodRep (Body class for method specification data)	379
DataModel (Handle class for model specification data)	394
DataModelRep (Body class for model specification data)	396
DataResponses (Handle class for responses specification data)	401
DataResponsesRep (Body class for responses specification data)	403
DataStrategy (Handle class for strategy specification data)	408
DataStrategyRep (Body class for strategy specification data)	410
DataVariables (Handle class for variables specification data)	413
DataVariablesRep (Body class for variables specification data)	415
DDACEDesignCompExp (Wrapper class for the DDACE design of experiments library)	426
DirectApplicInterface (Derived application interface class which spawns simulation codes and testers using direct procedure calls)	431
DiscrepancyCorrection (Base class for discrepancy corrections)	441
DOTOptimizer (Wrapper class for the DOT optimization library)	446
Driver (A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm)	451
EffGlobalMinimizer (Implementation of Efficient Global Optimization/Least Squares algorithms)	453
EmbeddedHybridStrategy (Strategy for closely-coupled hybrid minimization, typically involving the embedding of local search methods within global search methods)	456
Evaluator (An evaluator specialization that knows how to interact with Dakota)	458
EvaluatorCreator (A specialization of the <code>JEGA::FrontEnd::EvaluatorCreator</code> that creates a new instance of a Evaluator)	465
ForkAnalysisCode (Derived class in the AnalysisCode class hierarchy which spawns simulations using forks)	467
ForkApplicInterface (Derived application interface class which spawns simulation codes using forks)	469
FSUDesignCompExp (Wrapper class for the FSUDace QMC/CVT library)	473
GaussProcApproximation (Derived approximation class for Gaussian Process implementation)	478
GetLongOpt (GetLongOpt is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France))	485
Graphics (Single interface to 2D (motif) and 3D (PLPLOT) graphics as well as tabular cataloguing of data for post-processing with Matlab, Tecplot, etc)	489
GridApplicInterface (Derived application interface class which spawns simulation codes using grid services such as Condor or Globus)	493
HierarchSurrModel (Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity))	496
HybridStrategy (Base class for hybrid minimization strategies)	501
Interface (Base class for the interface class hierarchy)	503
Iterator (Base class for the iterator class hierarchy)	513
JEGAOptimizer (A version of Dakota::Optimizer for instantiation of John Eddy's Genetic Algorithms (JEGA))	527
LeastSq (Base class for the nonlinear least squares branch of the iterator hierarchy)	536
MergedConstraints (Derived class within the Constraints hierarchy which employs the merged data view)	541
MergedVariables (Derived class within the Variables hierarchy which employs the merged data view) .	543
Minimizer (Base class for the optimizer and least squares branches of the iterator hierarchy)	545
MixedConstraints (Derived class within the Constraints hierarchy which employs the default data view (no variable or domain type array merging))	555
MixedVariables (Derived class within the Variables hierarchy which employs the default data view (no variable or domain type array merging))	557
Model (Base class for the model class hierarchy)	559

MPIPackBuffer (Class for packing MPI message buffers)	592
MPIUnpackBuffer (Class for unpacking MPI message buffers)	595
NCSUOptimizer (Wrapper class for the NCSU DIRECT optimization library)	598
NestedModel (Derived model class which performs a complete sub-iterator execution within every evaluation of the model)	602
NIDRProblemDescDB (The derived input file database utilizing the new IDR parser)	612
NL2Res (Auxiliary information passed to calc r and calc j via ur)	617
NL2SOLLeastSq (Wrapper class for the NL2SOL nonlinear least squares library)	618
NLPQLPOptimizer (Wrapper class for the NLPQLP optimization library, Version 2.0)	621
NLSSOLLeastSq (Wrapper class for the NLSSOL nonlinear least squares library)	627
NoDBBaseConstructor (Dummy struct for overloading constructors used in on-the-fly instantiations) .	629
NonD (Base class for all nondeterministic iterators (the DAKOTA/UQ branch))	630
NonDAdaptImpSampling (Class for the Adaptive Importance Sampling methods within DAKOTA) . .	640
NonDBayesCalibration (Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data)	644
NonDCalibration	646
NonDCubature (Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals)	649
NonDExpansion (Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC)) .	653
NonDGlobalEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ) .	660
NonDGlobalInterval (Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification)	662
NonDGlobalReliability (Class for global reliability methods within DAKOTA/UQ)	666
NonDGlobalSingleInterval (Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification)	669
NonDGPMsABayesCalibration (Generates posterior distribution on model parameters given experiment data)	671
NonDIncrLHSampling (Performs icremental LHS sampling for uncertainty quantification)	674
NonDIntegration (Derived nondeterministic class that generates N-dimensional numerical integration points for evaluation of expectation integrals)	677
NonDInterval (Base class for interval-based methods within DAKOTA/UQ)	680
NonDLHSEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ) .	683
NonDLHSInterval (Class for the LHS-based interval methods within DAKOTA/UQ)	685
NonDLHSSampling (Performs LHS and Monte Carlo sampling for uncertainty quantification)	687
NonDLHSSingleInterval (Class for pure interval propagation using LHS)	690
NonDLocalEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ) .	692
NonDLocalInterval (Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification)	694
NonDLocalReliability (Class for the reliability methods within DAKOTA/UQ)	697
NonDLocalSingleInterval (Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification)	706
NonDPolynomialChaos (Nonintrusive polynomial chaos expansion approaches to uncertainty quantification)	708
NonDQuadrature (Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas)	711
NonDQUESOBayesCalibration (Bayesian inference using the QUESO library from UT Austin)	716
NonDReliability (Base class for the reliability methods within DAKOTA/UQ)	719

NonDSampling (Base class for common code between NonDLHSSampling , NonDIncremLHSSampling , and NonDAdaptImpSampling)	724
NonDSParseGrid (Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables)	731
NonDStochCollocation (Nonintrusive stochastic collocation approaches to uncertainty quantification)	735
NPSOLOptimizer (Wrapper class for the NPSOL optimization library)	737
Optimizer (Base class for the optimizer branch of the iterator hierarchy)	741
ParallelConfiguration (Container class for a set of ParallelLevel list iterators that collectively identify a particular multilevel parallel configuration)	747
ParallelDirectApplicInterface (Sample derived interface class for testing parallel simulator plug-ins using assign_rep())	749
ParallelLevel (Container class for the data associated with a single level of communicator partitioning)	750
ParallelLibrary (Class for partitioning multiple levels of parallelism and managing message passing within these levels)	754
ParamResponsePair (Container class for a variables object, a response object, and an evaluation id)	768
ParamStudy (Class for vector, list, centered, and multidimensional parameter studies)	772
partial_prp_equality (Predicate for comparing ONLY the interfaceId and Vars attributes of PRPair)	777
partial_prp_hash (Wrapper to delegate to the ParamResponsePair hash_value function)	778
PecosApproximation (Derived approximation class for global basis polynomials)	779
ProblemDescDB (The database containing information parsed from the DAKOTA input file)	786
PStudyDACE (Base class for managing common aspects of parameter studies and design of experiments methods)	797
PSUADEDesignCompExp (Wrapper class for the PSUADE library)	800
RecastBaseConstructor (Dummy struct for overloading constructors used in on-the-fly Model instantiations)	804
RecastModel (Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs)	805
Response (Container class for response functions and their derivatives. Response provides the handle class)	814
ResponseRep (Container class for response functions and their derivatives. ResponseRep provides the body class)	820
RichExtrapVerification (Class for Richardson extrapolation for code and solution verification)	828
SensAnalysisGlobal (Class for a utility class containing correlation calculations and variance-based decomposition)	831
SequentialHybridStrategy (Strategy for sequential hybrid minimization using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity)	833
SerialDirectApplicInterface (Sample derived interface class for testing serial simulator plug-ins using assign_rep())	838
SharedVariablesData (Container class encapsulating variables data that can be shared among a set of Variables instances)	839
SharedVariablesDataRep (The representation of a SharedVariablesData instance. This representation, or body, may be shared by multiple SharedVariablesData handle instances)	842
SingleMethodStrategy (Simple fall-through strategy for running a single iterator on a single model)	845
SingleModel (Derived model class which utilizes a single interface to map variables into responses)	847
SNLLBase (Base class for OPT++ optimization and least squares methods)	850
SNLLLeastSq (Wrapper class for the OPT++ optimization library)	853
SNLLOptimizer (Wrapper class for the OPT++ optimization library)	858
SOLBase (Base class for Stanford SOL software)	866
Strategy (Base class for the strategy class hierarchy)	869

String (Dakota::String class, used as main string class for Dakota)	878
SurfpackApproximation (Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota)	881
SurrBasedGlobalMinimizer (The global surrogate-based minimizer which sequentially minimizes and updates a global surrogate model without trust region controls)	885
SurrBasedLocalMinimizer (Class for provably-convergent local surrogate-based optimization and non-linear least squares)	887
SurrBasedMinimizer (Base class for local/global surrogate-based optimization/least squares)	896
SurrogateModel (Base class for surrogate models (DataFitSurrModel and HierarchSurrModel))	902
SysCallAnalysisCode (Derived class in the AnalysisCode class hierarchy which spawns simulations using system calls)	907
SysCallApplicInterface (Derived application interface class which spawns simulation codes using system calls)	909
TANA3Approximation (Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation))	912
TaylorApproximation (Derived approximation class for first- or second-order Taylor series (a local approximation))	915
TrackerHTTP (TrackerHTTP: a usage tracking module that uses HTTP/HTTPS via the curl library)	917
Variables (Base class for the variables class hierarchy)	920
Verification (Base class for managing common aspects of verification studies)	933

Chapter 41

File Index

41.1 File List

Here is a list of all documented files with brief descriptions:

dll_api.C (This file contains a DakotaRunner class, which launches DAKOTA)	935
dll_api.h (API for DLL interactions)	937
JEGAOptimizer.C (Contains the implementation of the JEGAOptimizer class)	939
JEGAOptimizer.H (Contains the definition of the JEGAOptimizer class)	940
library_mode.C (File containing a mock simulator main for testing DAKOTA in library mode)	941
library_split.C (File containing a mock simulator main for testing DAKOTA in library mode on a split communicator)	943
main.C (File containing the main program for DAKOTA)	944
restart_util.C (File containing the DAKOTA restart utility main program)	945

Chapter 42

Namespace Documentation

42.1 Dakota Namespace Reference

The primary namespace for DAKOTA.

Classes

- class [AnalysisCode](#)
Base class providing common functionality for derived classes ([SysCallAnalysisCode](#) and [ForkAnalysisCode](#)) which spawn separate processes for managing simulations.
- class [ApplicationInterface](#)
Derived class within the interface class hierarchy for supporting interfaces to simulation codes.
- class [ApproximationInterface](#)
Derived class within the interface class hierarchy for supporting approximations to simulation-based results.
- class [APPSEvalMgr](#)
Evaluation manager class for APPSPACK.
- class [APPSOptimizer](#)
Wrapper class for APPSPACK.
- class [COLINApplication](#)
- class [COLINOptimizer](#)
Wrapper class for optimizers defined using COLIN.
- class [CollaborativeHybridStrategy](#)
Strategy for hybrid minimization using multiple collaborating optimization and nonlinear least squares methods.
- class [GetLongOpt](#)

[GetLongOpt](#) is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France).

- class [CommandLineHandler](#)
Utility class for managing command line inputs to DAKOTA.
- class [CommandShell](#)
Utility class which defines convenience operators for spawning processes with system calls.
- class [ConcurrentStrategy](#)
Strategy for multi-start iteration or pareto set optimization.
- class [CONMINOptimizer](#)
Wrapper class for the CONMIN optimization library.
- class [ActiveSet](#)
Container class for active set tracking information. Contains the active set request vector and the derivative variables vector.
- class [Analyzer](#)
Base class for [NonD](#), [DACE](#), and [ParamStudy](#) branches of the iterator hierarchy.
- class [Approximation](#)
Base class for the approximation class hierarchy.
- class [BiStream](#)
The binary input stream class. Overloads the >> operator for all data types.
- class [BoStream](#)
The binary output stream class. Overloads the << operator for all data types.
- class [Constraints](#)
Base class for the variable constraints class hierarchy.
- class [Graphics](#)
The [Graphics](#) class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics as well as tabular cataloging of data for post-processing with Matlab, Tecplot, etc.
- class [Interface](#)
Base class for the interface class hierarchy.
- class [Iterator](#)
Base class for the iterator class hierarchy.
- class [LeastSq](#)
Base class for the nonlinear least squares branch of the iterator hierarchy.

- class [Minimizer](#)

Base class for the optimizer and least squares branches of the iterator hierarchy.

- class [Model](#)

Base class for the model class hierarchy.

- class [NonD](#)

Base class for all nondeterministic iterators (the DAKOTA/UQ branch).

- class [Optimizer](#)

Base class for the optimizer branch of the iterator hierarchy.

- class [PStudyDACE](#)

Base class for managing common aspects of parameter studies and design of experiments methods.

- class [ResponseRep](#)

Container class for response functions and their derivatives. [ResponseRep](#) provides the body class.

- class [Response](#)

Container class for response functions and their derivatives. [Response](#) provides the handle class.

- class [Strategy](#)

Base class for the strategy class hierarchy.

- class [String](#)

Dakota::String class, used as main string class for Dakota.

- class [Variables](#)

Base class for the variables class hierarchy.

- class [Verification](#)

Base class for managing common aspects of verification studies.

- class [DataFitSurrModel](#)

Derived model class within the surrogate model branch for managing data fit surrogates (global and local).

- class [DataInterface](#)

Handle class for interface specification data.

- class [DataMethodRep](#)

Body class for method specification data.

- class [DataMethod](#)

Handle class for method specification data.

- class [DataModelRep](#)

Body class for model specification data.

- class [DataModel](#)

Handle class for model specification data.

- class [DataResponsesRep](#)

Body class for responses specification data.

- class [DataResponses](#)

Handle class for responses specification data.

- class [DataStrategyRep](#)

Body class for strategy specification data.

- class [DataStrategy](#)

Handle class for strategy specification data.

- class [DataVariablesRep](#)

Body class for variables specification data.

- class [DataVariables](#)

Handle class for variables specification data.

- class [DDACEDesignCompExp](#)

Wrapper class for the DDACE design of experiments library.

- class [DirectApplicInterface](#)

Derived application interface class which spawns simulation codes and testers using direct procedure calls.

- class [DiscrepancyCorrection](#)

Base class for discrepancy corrections.

- class [DOTOptimizer](#)

Wrapper class for the DOT optimization library.

- class [EffGlobalMinimizer](#)

Implementation of Efficient Global Optimization/Least Squares algorithms.

- class [EmbeddedHybridStrategy](#)

Strategy for closely-coupled hybrid minimization, typically involving the embedding of local search methods within global search methods.

- class [ForkAnalysisCode](#)

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using forks.

- class [ForkApplicInterface](#)

Derived application interface class which spawns simulation codes using forks.

- class [FSUDesignCompExp](#)

Wrapper class for the FSUDace QMC/CVT library.

- class [GaussProcApproximation](#)

Derived approximation class for Gaussian Process implementation.

- struct [BaseConstructor](#)

Dummy struct for overloading letter-envelope constructors.

- struct [NoDBBaseConstructor](#)

Dummy struct for overloading constructors used in on-the-fly instantiations.

- struct [RecastBaseConstructor](#)

Dummy struct for overloading constructors used in on-the-fly [Model](#) instantiations.

- class [GridApplicInterface](#)

Derived application interface class which spawns simulation codes using grid services such as Condor or Globus.

- class [HierarchSurrModel](#)

Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity).

- class [HybridStrategy](#)

Base class for hybrid minimization strategies.

- class [JEGAOptimizer](#)

A version of [Dakota::Optimizer](#) for instantiation of John Eddy's Genetic Algorithms (JEGA).

- class [MergedConstraints](#)

Derived class within the [Constraints](#) hierarchy which employs the merged data view.

- class [MergedVariables](#)

Derived class within the [Variables](#) hierarchy which employs the merged data view.

- class [MixedConstraints](#)

Derived class within the [Constraints](#) hierarchy which employs the default data view (no variable or domain type array merging).

- class [MixedVariables](#)

Derived class within the [Variables](#) hierarchy which employs the default data view (no variable or domain type array merging).

- class [MPIPackBuffer](#)

Class for packing MPI message buffers.

- class [MPIUnpackBuffer](#)
Class for unpacking MPI message buffers.
- class [NCSUOptimizer](#)
Wrapper class for the NCSU DIRECT optimization library.
- class [NestedModel](#)
Derived model class which performs a complete sub-iterator execution within every evaluation of the model.
- class [NIDRProblemDescDB](#)
The derived input file database utilizing the new IDR parser.
- struct [NL2Res](#)
Auxiliary information passed to calcr and calcj via ur.
- class [NL2SOLLeastSq](#)
Wrapper class for the NL2SOL nonlinear least squares library.
- class [NLPQLPOptimizer](#)
Wrapper class for the NLPQLP optimization library, Version 2.0.
- class [NLSSOLLeastSq](#)
Wrapper class for the NLSSOL nonlinear least squares library.
- class [NonDAdaptImpSampling](#)
Class for the Adaptive Importance Sampling methods within DAKOTA.
- class [NonDBayesCalibration](#)
Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data.
- class [NonDCalibration](#)
- class [NonDCubature](#)
Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals.
- class [NonDExpansion](#)
Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC).
- class [NonDGlobalEvidence](#)
Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.
- class [NonDGlobalInterval](#)
Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.
- class [NonDGlobalReliability](#)

Class for global reliability methods within DAKOTA/UQ.

- class [NonDGlobalSingleInterval](#)

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- class [NonDGPMSSABayesCalibration](#)

Generates posterior distribution on model parameters given experiment data.

- class [NonDIncremLHSSampling](#)

Performs incremental LHS sampling for uncertainty quantification.

- class [NonDIntegration](#)

Derived nondeterministic class that generates N-dimensional numerical integration points for evaluation of expectation integrals.

- class [NonDInterval](#)

Base class for interval-based methods within DAKOTA/UQ.

- class [NonDLHSEvidence](#)

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

- class [NonDLHSInterval](#)

Class for the LHS-based interval methods within DAKOTA/UQ.

- class [NonDLHSSampling](#)

Performs LHS and Monte Carlo sampling for uncertainty quantification.

- class [NonDLHSSingleInterval](#)

Class for pure interval propagation using LHS.

- class [NonDLocalEvidence](#)

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

- class [NonDLocalInterval](#)

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- class [NonDLocalReliability](#)

Class for the reliability methods within DAKOTA/UQ.

- class [NonDLocalSingleInterval](#)

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- class [NonDPolynomialChaos](#)

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.

- class [NonDQuadrature](#)

Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas.

- class [NonDQUESOBayesCalibration](#)

Bayesian inference using the QUESO library from UT Austin.

- class [NonDReliability](#)

Base class for the reliability methods within DAKOTA/UQ.

- class [NonDSampling](#)

Base class for common code between [NonDLHSSampling](#), [NonDIncrLHSSampling](#), and [NonDAdeptImpSampling](#).

- class [NonDSparseGrid](#)

Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables.

- class [NonDStochCollocation](#)

Nonintrusive stochastic collocation approaches to uncertainty quantification.

- class [NPSOLOptimizer](#)

Wrapper class for the NPSOL optimization library.

- class [ParallelLevel](#)

Container class for the data associated with a single level of communicator partitioning.

- class [ParallelConfiguration](#)

Container class for a set of [ParallelLevel](#) list iterators that collectively identify a particular multilevel parallel configuration.

- class [ParallelLibrary](#)

Class for partitioning multiple levels of parallelism and managing message passing within these levels.

- class [ParamResponsePair](#)

Container class for a variables object, a response object, and an evaluation id.

- class [ParamStudy](#)

Class for vector, list, centered, and multidimensional parameter studies.

- class [PecosApproximation](#)

Derived approximation class for global basis polynomials.

- class [ProblemDescDB](#)

The database containing information parsed from the DAKOTA input file.

- struct [partial_prp_hash](#)
wrapper to delegate to the [ParamResponsePair](#) hash_value function
- struct [partial_prp_equality](#)
predicate for comparing ONLY the interfaceId and Vars attributes of PRPair
- class [PSUADEDesignCompExp](#)
Wrapper class for the PSUADE library.
- class [RecastModel](#)
Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs.
- class [RichExtrapVerification](#)
Class for Richardson extrapolation for code and solution verification.
- class [SensAnalysisGlobal](#)
Class for a utility class containing correlation calculations and variance-based decomposition.
- class [SequentialHybridStrategy](#)
Strategy for sequential hybrid minimization using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity.
- class [SharedVariablesDataRep](#)
The representation of a [SharedVariablesData](#) instance. This representation, or body, may be shared by multiple [SharedVariablesData](#) handle instances.
- class [SharedVariablesData](#)
Container class encapsulating variables data that can be shared among a set of [Variables](#) instances.
- class [SingleMethodStrategy](#)
Simple fall-through strategy for running a single iterator on a single model.
- class [SingleModel](#)
Derived model class which utilizes a single interface to map variables into responses.
- class [SNLLBase](#)
Base class for OPT++ optimization and least squares methods.
- class [SNLLLeastSq](#)
Wrapper class for the OPT++ optimization library.
- class [SNLLOptimizer](#)
Wrapper class for the OPT++ optimization library.
- class [SOLBase](#)

Base class for Stanford SOL software.

- class [SurfpackApproximation](#)

Derived approximation class for Surfpack approximation classes. [Interface between Surfpack and Dakota](#).

- class [SurrBasedGlobalMinimizer](#)

The global surrogate-based minimizer which sequentially minimizes and updates a global surrogate model without trust region controls.

- class [SurrBasedLocalMinimizer](#)

Class for provably-convergent local surrogate-based optimization and nonlinear least squares.

- class [SurrBasedMinimizer](#)

Base class for local/global surrogate-based optimization/least squares.

- class [SurrogateModel](#)

Base class for surrogate models ([DataFitSurrModel](#) and [HierarchSurrModel](#)).

- class [SysCallAnalysisCode](#)

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using system calls.

- class [SysCallApplicInterface](#)

Derived application interface class which spawns simulation codes using system calls.

- class [TANA3Approximation](#)

Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation).

- class [TaylorApproximation](#)

Derived approximation class for first- or second-order Taylor series (a local approximation).

- class [TrackerHTTP](#)

[TrackerHTTP](#): a usage tracking module that uses HTTP/HTTPS via the curl library.

Typedefs

- **typedef double Real**
- **typedef Teuchos::SerialDenseVector< int, Real > RealVector**
- **typedef Teuchos::SerialDenseVector< int, int > IntVector**

- `typedef struct dirent dirent`
- `typedef struct Dakota::Cbuf Cbuf`
- `typedef struct Dakota::Buf Buf`
- `typedef struct Dakota::Finfo Finfo`
- `typedef Teuchos::SerialDenseSolver< int, Real > RealSolver`
- `typedef Teuchos::SerialSpdDenseSolver< int, Real > RealSpdSolver`

- `typedef int(* start_grid_computing_t)(char *analysis_driver_script, char *params_file, char *results_file)`
definition of start grid computing type (function pointer)
- `typedef int(* perform_analysis_t)(char *iteration_num)`
definition of perform analysis type (function pointer)
- `typedef int *(* get_jobs_completed_t)()`
definition of get completed jobs type (function pointer)
- `typedef int(* stop_grid_computing_t)()`
definition of stop grid computing type (function pointer)
- `typedef unsigned char u_char`
- `typedef unsigned short u_short`
- `typedef unsigned int u_int`
- `typedef unsigned long u_long`
- `typedef long long long_long`
- `typedef unsigned long UL`
- `typedef void(* Calcrj)(int *n, int *p, Real *x, int *nf, Real *r, int *ui, void *ur, Vf vf)`
- `typedef void(* Vf)()`
- `typedef MPI_Comm`
- `typedef void *MPI_Request`
- `typedef bmi::multi_index_container< Dakota::ParamResponsePair, bmi::indexed_by< bmi::ordered_unique< bmi::tag< ordered >, bmi::const_mem_fun< Dakota::ParamResponsePair, const IntStringPair &,&Dakota::ParamResponsePair::eval_interface_ids > >, bmi::hashed_non_unique< bmi::tag< hashed >, bmi::identity< Dakota::ParamResponsePair >, partial_prp_hash, partial_prp_equality > >> PRPMultiIndexCache`

Boost Multi-Index Container for globally caching ParamResponsePairs.

- `typedef PRPMultiIndexCache PRPCache`
- `typedef PRPCache::index_iterator< ordered >::type PRPCacheOIter`
- `typedef PRPCache::index_const_iterator< ordered >::type PRPCacheOCIter`
- `typedef PRPCache::index_iterator< hashed >::type PRPCacheHIter`
- `typedef PRPCache::index_const_iterator< hashed >::type PRPCacheHCIter`
- `typedef PRPCacheOIter PRPCacheIter`
- `typedef PRPCacheOCIter PRPCacheCIter`
- `typedef bmi::multi_index_container< Dakota::ParamResponsePair, bmi::indexed_by< bmi::ordered_unique< bmi::tag< ordered >, bmi::const_mem_fun< Dakota::ParamResponsePair, int,&Dakota::ParamResponsePair::eval_id > >, bmi::hashed_non_unique< bmi::tag< hashed >, bmi::identity< Dakota::ParamResponsePair >, partial_prp_hash, partial_prp_equality > >> PRPMultiIndexQueue`

Boost Multi-Index Container for locally queueing ParamResponsePairs.

- `typedef PRPMultiIndexQueue PRPQueue`
- `typedef PRPQueue::index_iterator< ordered >::type PRPQueueOIter`
- `typedef PRPQueue::index_const_iterator< ordered >::type PRPQueueOCIter`
- `typedef PRPQueue::index_iterator< hashed >::type PRPQueueHIter`

- `typedef PRPQueue::index_const_iterator< hashed >::type PRPQueueHCIter`
- `typedef PRPQueueOIter PRPQueueIter`
- `typedef PRPQueueOClIter PRPQueueCIter`

 CG_STEEPEST, **CG_FLETCHER_REEVES**, **CG_POLAK_RIBIERE**, **CG_POLAK_RIBIERE_PLUS**,

 CG_HESTENES_STIEFEL }

NonlinearCG update options.
- enum **CG_LINESEARCHTYPE** { **CG_FIXED_STEP**, **CG_LS_SIMPLE**, **CG_LS_BRENT**, **CG_LS_WOLFE** }

NonlinearCG linesearch options.
- enum {

 LIST = 1, **VECTOR_SV**, **VECTOR_FP**, **CENTERED**,

 MULTIDIM }
- enum { **ESTIMATE_ORDER** = 1, **CONVERGE_ORDER**, **CONVERGE_QOI** }
- enum **EvalType** { **NLFEvaluator**, **CONEvaluator** }

enumeration for the type of evaluator function
- enum {

 TH_SILENT_OUTPUT, **TH QUIET_OUTPUT**, **TH_NORMAL_OUTPUT**, **TH_VERBOSE_OUTPUT**,

 TH_DEBUG_OUTPUT }

Functions

- static const char * **basename** (const char *s)

return name of s, stripped of any leading path information
- static void **cleanup_and_abort** (const std::string &resname)

output error message about results file and call abort
- **CommandShell** & **flush** (**CommandShell** &shell)

convenient shell manipulator function to "flush" the shell
- bool **operator==** (const **ActiveSet** &set1, const **ActiveSet** &set2)

equality operator for ActiveSet
- std::istream & **operator>>** (std::istream &s, **ActiveSet** &set)

std::istream extraction operator for ActiveSet. Calls read(std::istream&).
- std::ostream & **operator<<** (std::ostream &s, const **ActiveSet** &set)

std::ostream insertion operator for ActiveSet. Calls write(std::ostream&).
- **BiStream** & **operator>>** (**BiStream** &s, **ActiveSet** &set)

BiStream extraction operator for ActiveSet. Calls read(BiStream&).

- `BoStream & operator<< (BoStream &s, const ActiveSet &set)`
`BoStream` insertion operator for `ActiveSet`. Calls `write(BoStream&)`.
- `MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, ActiveSet &set)`
`MPIUnpackBuffer` extraction operator for `ActiveSet`. Calls `read(MPIUnpackBuffer&)`.
- `MPIPackBuffer & operator<< (MPIPackBuffer &s, const ActiveSet &set)`
`MPIPackBuffer` insertion operator for `ActiveSet`. Calls `write(MPIPackBuffer&)`.
- `bool operator!= (const ActiveSet &set1, const ActiveSet &set2)`
inequality operator for ActiveSet
- template<class ArrayT >
`void array_read (ArrayT &v, BiStream &s)`
Read an array from BiStream, s.
- template<class ArrayT >
`void array_write (const ArrayT &v, BoStream &s)`
Write an array to BoStream, s.
- template<class ArrayT >
`BiStream & operator>> (BiStream &s, ArrayT &data)`
global BiStream extraction operator for generic "array" container
- template<class ArrayT >
`BoStream & operator<< (BoStream &s, const ArrayT &data)`
global BoStream insertion operator for generic "array" container
- `std::istream & operator>> (std::istream &s, Constraints &con)`
std::istream extraction operator for Constraints
- `std::ostream & operator<< (std::ostream &s, const Constraints &con)`
std::ostream insertion operator for Constraints
- `bool interface_id_compare (const Interface &interface, const void *id)`
global comparison function for Interface
- `bool method_id_compare (const Iterator &iterator, const void *id)`
global comparison function for Iterator
- `bool model_id_compare (const Model &model, const void *id)`
global comparison function for Model
- `bool operator== (const ResponseRep &rep1, const ResponseRep &rep2)`
equality operator for ResponseRep

- `bool responses_id_compare (const Response &resp, const void *id)`
global comparison function for `Response`
- `std::istream & operator>> (std::istream &s, Response &response)`
std::istream extraction operator for `Response`. Calls `read(std::istream&)`.
- `std::ostream & operator<< (std::ostream &s, const Response &response)`
std::ostream insertion operator for `Response`. Calls `write(std::ostream&)`.
- `BiStream & operator>> (BiStream &s, Response &response)`
`BiStream` extraction operator for `Response`. Calls `read(BiStream&)`.
- `BoStream & operator<< (BoStream &s, const Response &response)`
`BoStream` insertion operator for `Response`. Calls `write(BoStream&)`.
- `MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, Response &response)`
`MPIUnpackBuffer` extraction operator for `Response`. Calls `read(MPIUnpackBuffer&)`.
- `MPIPackBuffer & operator<< (MPIPackBuffer &s, const Response &response)`
`MPIPackBuffer` insertion operator for `Response`. Calls `write(MPIPackBuffer&)`.
- `bool operator== (const Response &resp1, const Response &resp2)`
equality operator for `Response`
- `bool operator!= (const Response &resp1, const Response &resp2)`
inequality operator for `Response`
- `std::string re_match (const std::string &token, const boost::regex &re)`
Global utility function to ease migration from `CtelRegEx` to `Boost.Regex`.
- `MPIPackBuffer & operator<< (MPIPackBuffer &s, const String &data)`
Reads `String` from buffer.
- `MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, String &data)`
Writes `String` to buffer.
- `String operator+ (const String &s1, const String &s2)`
Concatenate two `String`s and return the resulting `String`.
- `String operator+ (const char *s1, const String &s2)`
Append a `String` to a `char` and return the resulting `String`.*
- `String operator+ (const String &s1, const char *s2)`
Append a `char` to a `String` and return the resulting `String`.*

- **String operator+** (const std::string &s1, const String &s2)
Append a String to a std::string and return the resulting String.
- **String operator+** (const String &s1, const std::string &s2)
Append a std::string to a String and return the resulting String.
- **String toUpper** (const String &str)
Returns a String converted to upper case. Calls String::upper().
- **String toLower** (const String &str)
Returns a String converted to lower case. Calls String::lower().
- **bool operator==** (const Variables &vars1, const Variables &vars2)
equality operator for Variables
- **bool binary_equal_to** (const Variables &vars1, const Variables &vars2)
binary_equal_to (since 'operator==' is not suitable for boost/hashed lookup)
- **std::size_t hash_value** (const Variables &vars)
hash_value for Variables - required by the new BMI hash_set of PRPairs
- **bool variables_id_compare** (const Variables &vars, const void *id)
global comparison function for Variables
- **std::istream & operator>>** (std::istream &s, Variables &vars)
std::istream extraction operator for Variables.
- **std::ostream & operator<<** (std::ostream &s, const Variables &vars)
std::ostream insertion operator for Variables.
- **BiStream & operator>>** (BiStream &s, Variables &vars)
BiStream extraction operator for Variables.
- **BoStream & operator<<** (BoStream &s, const Variables &vars)
BoStream insertion operator for Variables.
- **MPIUnpackBuffer & operator>>** (MPIUnpackBuffer &s, Variables &vars)
MPIUnpackBuffer extraction operator for Variables.
- **MPIPackBuffer & operator<<** (MPIPackBuffer &s, const Variables &vars)
MPIPackBuffer insertion operator for Variables.
- **bool operator!=** (const Variables &vars1, const Variables &vars2)
inequality operator for Variables

- template<class T >
std::ostream & **operator<<** (std::ostream &s, const std::set< T > &data)
global std::ostream insertion operator for std::set
- template<class T >
MPIUnpackBuffer & **operator>>** (**MPIUnpackBuffer** &s, std::set< T > &data)
global MPIUnpackBuffer extraction operator for std::set
- template<class T >
MPIPackBuffer & **operator<<** (**MPIPackBuffer** &s, const std::set< T > &data)
global MPIPackBuffer insertion operator for std::set
- template<typename OrdinalType , typename ScalarType >
MPIPackBuffer & **operator<<** (**MPIPackBuffer** &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &data)
global MPIPackBuffer insertion operator for Teuchos::SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
MPIPackBuffer & **operator<<** (**MPIPackBuffer** &s, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &data)
global MPIPackBuffer insertion operator for Teuchos::SerialDenseMatrix
- template<typename OrdinalType , typename ScalarType >
MPIPackBuffer & **operator<<** (**MPIPackBuffer** &s, const Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &data)
global MPIPackBuffer insertion operator for Teuchos::SerialSymDenseMatrix
- template<typename OrdinalType , typename ScalarType >
MPIUnpackBuffer & **operator>>** (**MPIUnpackBuffer** &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &data)
global MPIUnpackBuffer extraction operator for Teuchos::SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
MPIUnpackBuffer & **operator>>** (**MPIUnpackBuffer** &s, Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &data)
global MPIUnpackBuffer extraction operator for Teuchos::SerialDenseMatrix
- template<typename OrdinalType , typename ScalarType >
MPIUnpackBuffer & **operator>>** (**MPIUnpackBuffer** &s, Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &data)
global MPIUnpackBuffer extraction operator for Teuchos::SerialSymDenseMatrix
- template<typename OrdinalType , typename ScalarType >
void **read_data** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
standard istream extraction operator for full SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
void **read_data** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArray &label_array)
standard istream extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArrayView label_array)
standard istream extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data_partial** (std::istream &s, size_t start_index, size_t num_items,
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
standard istream extraction operator for partial SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
void **read_data_partial** (std::istream &s, size_t start_index, size_t num_items,
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArray &label_array)
standard istream extraction operator for partial SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data_partial** (std::istream &s, size_t start_index, size_t num_items,
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArrayView label_array)
standard istream extraction operator for partial SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data_tabular** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
tabular istream extraction operator for full SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
void **read_data_partial_tabular** (std::istream &s, size_t start_index, size_t num_items,
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
tabular istream extraction operator for partial SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
void **read_data_annotated** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
StringMultiArray &label_array)
annotated istream extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data_annotated** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
StringMultiArrayView label_array)
annotated istream extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const ScalarType *v, OrdinalType len)

standard ostream insertion operator for full SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
standard ostream insertion operator for full SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
const StringMultiArray &label_array)
standard ostream insertion operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
StringMultiArrayConstView label_array)
standard ostream insertion operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
const StringArray &label_array)
standard ostream insertion operator for full SerialDenseVector with alternate labels
- template<typename OrdinalType , typename ScalarType >
void **write_data_aprepro** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType >
&v, const StringMultiArray &label_array)
aprepro ostream insertion operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data_partial** (std::ostream &s, size_t start_index, size_t num_items, const
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
standard ostream insertion operator for partial SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
void **write_data_partial** (std::ostream &s, size_t start_index, size_t num_items, const
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
standard ostream insertion operator for partial SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data_partial_aprepro** (std::ostream &s, size_t start_index, size_t num_items, const
Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
aprepro ostream insertion operator for partial SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data_annotated** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType >
&v, const StringMultiArray &label_array)
annotated ostream insertion operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **write_data_tabular** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
tabular ostream insertion operator for full SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
void **write_data_tabular** (std::ostream &s, const ScalarType *ptr, OrdinalType num_items)
tabular ostream insertion operator for full SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
void **write_data_partial_tabular** (std::ostream &s, size_t start_index, size_t num_items, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
tabular ostream insertion operator for partial SerialDenseVector
- void **write_data_tabular** (std::ostream &s, const StringArray &sa)
tabular ostream insertion operator for vector of strings
- void **write_data_tabular** (std::ostream &s, StringMultiArrayConstView ma)
tabular ostream insertion operator for view of StringMultiArray
- template<typename OrdinalType , typename ScalarType >
std::istream & **operator>>** (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &data)
global std::istream extraction operator for SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
std::ostream & **operator<<** (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &data)
global std::ostream insertion operator for SerialDenseVector
- template<typename OrdinalType , typename ScalarType >
void **read_data** (BiStream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArray &label_array)
standard binary stream extraction operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **read_data** (BiStream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArrayView label_array)
standard binary stream extraction operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **write_data** (BoStream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
standard binary stream insertion operator for full SerialDenseVector with labels
- template<typename OrdinalType , typename ScalarType >
void **read_data** (MPIUnpackBuffer &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArray &label_array)

standard MPI buffer extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data** (**MPIUnpackBuffer** &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
StringMultiArrayView label_array)
standard MPI buffer extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **write_data** (**MPIPackBuffer** &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v,
const StringMultiArray &label_array)
standard MPI buffer insertion operator for full SerialDenseVector with labels

- template<typename OrdinalType , typename ScalarType >
void **read_data** (std::istream &s, std::vector< Teuchos::SerialDenseVector< OrdinalType, ScalarType > >
&va)
standard istream extraction operator for std::vector of SerialDenseVectors

- template<typename OrdinalType , typename ScalarType >
void **read_data** (std::istream &s, Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m)
standard istream extraction operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **read_data** (**BiStream** &s, Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m)
standard binary stream extraction operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **read_data** (**MPIUnpackBuffer** &s, Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m)
standard MPI buffer extraction operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m,
bool brackets, bool row_rtn, bool final_rtn)
formatted ostream insertion operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **write_data** (**BoStream** &s, const Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m)
standard binary stream insertion operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **write_data** (**MPIPackBuffer** &s, const Teuchos::SerialSymDenseMatrix< OrdinalType, ScalarType > &m)
standard MPI buffer insertion operator for SerialSymDenseMatrix

- template<typename OrdinalType , typename ScalarType >
void **write_data** (std::ostream &s, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &m,
bool brackets, bool row_rtn, bool final_rtn)

formatted ostream insertion operator for SerialDenseMatrix

- template<typename OrdinalType , typename ScalarType >
 void **write_data** (std::ostream &s, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &m,
 const StringArray &row_labels, const StringArray &col_labels)
ostream insertion operator for SerialDenseMatrix with row/col labels

- template<typename OrdinalType , typename ScalarType >
 void **write_col_vector_trans** (std::ostream &s, OrdinalType col, OrdinalType num_items, bool brackets,
 bool break_line, bool final_rtn, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm)
ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename OrdinalType , typename ScalarType >
 void **write_col_vector_trans** (std::ostream &s, OrdinalType col, bool brackets, bool break_line, bool final_-
 rtn, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm)
ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename OStreamType , typename OrdinalType , typename ScalarType >
 void **write_col_vector_trans** (OStreamType &s, OrdinalType col, OrdinalType num_items, const
 Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm)
ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename OStreamType , typename OrdinalType , typename ScalarType >
 void **write_col_vector_trans** (OStreamType &s, OrdinalType col, const Teuchos::SerialDenseMatrix< Or-
 dinalType, ScalarType > &sdm)
ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename IStreamType , typename OrdinalType , typename ScalarType >
 void **read_col_vector_trans** (IStreamType &s, OrdinalType col, Teuchos::SerialDenseMatrix< Ordinal-
 Type, ScalarType > &sdm)
istream extraction operator for a column vector from a SerialDenseMatrix

- template<class ArrayT >
 void **array_read** (ArrayT &v, std::istream &s)
read array from std::istream

- template<class ArrayT >
 void **array_write** (const ArrayT &v, std::ostream &s)
write array to std::ostream

- template<class ListT >
 void **list_write** (const ListT &l, std::ostream &s)
write list to std::ostream

- template<class T >
 std::istream & **operator>>** (std::istream &s, std::vector< T > &data)
global std::istream extraction operator for std::vector

- template<class T >
std::ostream & **operator<<** (std::ostream &s, const std::vector< T > &data)
global std::ostream insertion operator for std::vector
- template<class T >
std::ostream & **operator<<** (std::ostream &s, const std::list< T > &data)
global std::ostream insertion operator for std::list
- template<class ArrayT >
void **array_write** (std::ostream &s, const ArrayT &v, const std::vector< String > &label_array)
write array to std::ostream with labels
- template<class ArrayT >
void **array_write_aprepro** (std::ostream &s, const ArrayT &v, const std::vector< String > &label_array)
write array to std::ostream (APREPRO format)
- template<class ArrayT >
void **array_write_annotated** (const ArrayT &v, std::ostream &s, bool write_len)
Write array to ostream as a row vector; precede with length if write_len = true.
- bool **operator==** (const ShortArray &dsa1, const ShortArray &dsa2)
equality operator for ShortArray
- bool **operator==** (const StringArray &dsa1, const StringArray &dsa2)
equality operator for StringArray
- bool **operator==** (const SizetArray &sa, SizetMultiArrayConstView smav)
equality operator for SizetArray and SizetMultiArrayConstView
- bool **operator==** (const IntArray &dia1, const IntArray &dia2)
equality operator for IntArray
- bool **operator!=** (const IntArray &dia1, const IntArray &dia2)
inequality operator for IntArray
- bool **operator!=** (const ShortArray &dsa1, const ShortArray &dsa2)
inequality operator for ShortArray
- bool **operator!=** (const StringArray &dsa1, const StringArray &dsa2)
inequality operator for StringArray
- bool **operator!=** (const SizetArray &sa, SizetMultiArrayConstView smav)
inequality operator for SizetArray
- void **build_label** (String &label, const String &root_label, size_t tag)

create a label by appending a numerical tag to the root_label

- `void build_labels (StringArray &label_array, const String &root_label)`
create an array of labels by tagging root_label for each entry in label_array. Uses `build_label()`.
- `void build_labels (StringMultiArray &label_array, const String &root_label)`
create an array of labels by tagging root_label for each entry in label_array. Uses `build_label()`.
- `void build_labels_partial (StringArray &label_array, const String &root_label, size_t start_index, size_t num_items)`
create a partial array of labels by tagging root_label for a subset of entries in label_array. Uses `build_label()`.
- `void copy_row_vector (const RealMatrix &m, RealMatrix::ordinalType i, std::vector< Real > &row)`
Copies a row of a Teuchos_SerialDenseMatrix<int,Real> to std::vector<Real>.
- template<class T>
`void copy_data (const std::vector< T > &dbv, T *ptr, const int ptr_len)`
*copy Array<T> to T**
- template<typename OrdinalType , typename ScalarType >
`void copy_data (const std::vector< Teuchos::SerialDenseVector< OrdinalType, ScalarType > > &sdva, ScalarType *ptr, const OrdinalType ptr_len, const String &ptr_type)`
*copy Array<Teuchos::SerialDenseVector<OT,ST>> to ST**
- template<typename OrdinalType , typename ScalarType >
`void copy_data (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv, Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm, OrdinalType nr, OrdinalType nc)`
copy Teuchos::SerialDenseVector<OT,ST> to Teuchos::SerialDenseMatrix<OT,ST>
- template<class T>
`void copy_data (const std::list< T > &dl, std::vector< T > &da)`
copy std::list<T> to std::vector<T>
- template<class T>
`void copy_data (const std::list< T > &dl, std::vector< std::vector< T > > &d2a, size_t num_a, size_t a_len)`
copy std::list<T> to std::vector<std::vector<T>>
- template<class T>
`void copy_data (const std::vector< std::vector< T > > &d2a, std::vector< T > &da)`
copy std::vector<vector<T>> to std::vector<T>(unroll vecOfvecs into vector)
- template<class T>
`void copy_data (const std::map< int, T > &im, std::vector< T > &da)`
copy map<int, T> to std::vector<T> (discard integer keys)

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv1,
 Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv2)
copy Teuchos::SerialDenseVector<OrdinalType, ScalarType> to same (used in place of operator= when a deep copy of a vector view is needed)

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv, std::vector< ScalarType > &da)
copy Teuchos::SerialDenseVector<OrdinalType, ScalarType> to std::vector<ScalarType>

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const std::vector< ScalarType > &da, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv)
copy Array<ScalarType> to Teuchos::SerialDenseVector<OrdinalType, ScalarType>

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const ScalarType *ptr, const OrdinalType ptr_len, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv)
copy ScalarType to Teuchos::SerialDenseVector<OrdinalType, ScalarType>*

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv, ScalarType *ptr,
 const OrdinalType ptr_len)
copy ScalarType to Teuchos::SerialDenseVector<OrdinalType, ScalarType>*

- template<typename OrdinalType , typename ScalarType >
 void **copy_data** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv, std::vector< Teuchos::SerialDenseVector< OrdinalType, ScalarType > > &sdva, OrdinalType num_vec, OrdinalType vec_len)
copy SerialDenseVector<> to Array<SerialDenseVector<>>

- template<typename OrdinalType , typename ScalarType >
 void **copy_data_partial** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv1, OrdinalType start_index1, OrdinalType num_items, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv2)
copy portion of first SerialDenseVector to all of second SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
 void **copy_data_partial** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv1, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv2, OrdinalType start_index2)
copy all of first SerialDenseVector to portion of second SerialDenseVector

- template<typename OrdinalType , typename ScalarType >
 void **copy_data_partial** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv1, OrdinalType start_index1, OrdinalType num_items, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &sdv2, OrdinalType start_index2)
copy portion of first SerialDenseVector to portion of second SerialDenseVector

- template<class T >
 void **copy_data_partial** (const std::vector< T > &da1, size_t start_index1, size_t num_items, std::vector< T > &da2)
copy portion of first Array<T> to all of second Array<T>
- template<class T >
 void **copy_data_partial** (const std::vector< T > &da1, std::vector< T > &da2, size_t start_index2)
copy all of first Array<T> to portion of second Array<T>
- template<class T >
 void **copy_data_partial** (const std::vector< T > &da, boost::multi_array< T, 1 > &bma, size_t start_index_bma)
copy all of first Array<T> to portion of boost::multi_array<T, 1>
- template<class T >
 void **copy_data_partial** (const std::vector< T > &da1, size_t start_index1, size_t num_items, std::vector< T > &da2, size_t start_index2)
copy portion of first Array<T> to portion of second Array<T>
- void **merge_data_partial** (const IntVector &d_array, RealVector &m_array, size_t start_index_ma)
aggregate continuous and discrete arrays into a single merged array
- template<typename OrdinalType , typename ScalarType >
 const ScalarType & **set_index_to_value** (OrdinalType index, const std::set< ScalarType > &values)
retrieve the set value corresponding to the passed index
- template<typename ScalarType >
 size_t **set_value_to_index** (const ScalarType &value, const std::set< ScalarType > &values)
calculate the set index corresponding to the passed value
- template<typename OrdinalType , typename ScalarType >
 void **x_y_pairs_to_x_set** (const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &xy_pairs, std::set< ScalarType > &x_set)
convert a SerialDenseVector of head-to-tail (x,y) pairs into a std::set of (x), discarding the y values
- template<typename MultiArrayType , typename DataType >
 size_t **find_index** (const MultiArrayType &a, const DataType &search_data)
generic find_index (inactive)
- template<typename MultiArrayType , typename DakArrayType >
 void **copy_data** (const MultiArrayType &ma, DakArrayType &da)
generic copy (inactive)
- template<class T >
 size_t **find_index** (const boost::multi_array< T, 1 > &bma, const T &search_data)
compute the index of an entry within a boost::multi_array

- `size_t find_index (SizetMultiArrayConstView bmacy, size_t search_data)`
compute the index of an entry within a boost::multi_array view
- `size_t find_index (StringMultiArrayConstView bmacy, const String &search_data)`
compute the index of an entry within a boost::multi_array view
- template<class ListT >
`ListT::size_type find_index (const ListT &l, const typename ListT::value_type &val)`
compute the index of an entry within a std::list
- `void copy_data (SizetMultiArrayConstView ma, SizetArray &da)`
copy boost::multi_array view to Array
- `void copy_data (StringMultiArrayConstView ma, StringArray &da)`
copy boost::multi_array view to Array
- template<typename DakContainerType >
`bool contains (const DakContainerType &v, const typename DakContainerType::value_type &val)`
return true if the item val appears in container v
- template<class ListT >
`ListT::size_type count_if (const ListT &l, bool(*test_fn)(const typename ListT::value_type &, const std::string &), const std::string &test_fn_data)`
count the number of elements in the list satisfying the predicate test_fn w.r.t. the passed test_fn_data
- template<class ListT >
`ListT::const_iterator find_if (const ListT &c, bool(*test_fn)(const typename ListT::value_type &, const std::string &), const std::string &test_fn_data)`
return an iterator to the first list element satisfying the predicate test_fn w.r.t. the passed test_fn_data; end if not found
- Real `rel_change_rv (const RealVector &curr_rv, const RealVector &prev_rv)`
Computes relative change between successive RealVectors using Euclidean norm.
- `MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataInterface &data)`
MPIPackBuffer insertion operator for DataInterface.
- `MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, DataInterface &data)`
MPIUnpackBuffer extraction operator for DataInterface.
- `std::ostream & operator<< (std::ostream &s, const DataInterface &data)`
std::ostream insertion operator for DataInterface
- `MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataMethod &data)`
MPIPackBuffer insertion operator for DataMethod.

- **MPIUnpackBuffer & operator>>** (**MPIUnpackBuffer** &s, **DataMethod** &data)
MPIUnpackBuffer extraction operator for DataMethod.
- **std::ostream & operator<<** (std::ostream &s, const **DataMethod** &data)
std::ostream insertion operator for DataMethod
- **MPIPackBuffer & operator<<** (**MPIPackBuffer** &s, const **DataModel** &data)
MPIPackBuffer insertion operator for DataModel.
- **MPIUnpackBuffer & operator>>** (**MPIUnpackBuffer** &s, **DataModel** &data)
MPIUnpackBuffer extraction operator for DataModel.
- **std::ostream & operator<<** (std::ostream &s, const **DataModel** &data)
std::ostream insertion operator for DataModel
- **MPIPackBuffer & operator<<** (**MPIPackBuffer** &s, const **DataResponses** &data)
MPIPackBuffer insertion operator for DataResponses.
- **MPIUnpackBuffer & operator>>** (**MPIUnpackBuffer** &s, **DataResponses** &data)
MPIUnpackBuffer extraction operator for DataResponses.
- **std::ostream & operator<<** (std::ostream &s, const **DataResponses** &data)
std::ostream insertion operator for DataResponses
- **MPIPackBuffer & operator<<** (**MPIPackBuffer** &s, const **DataStrategy** &data)
MPIPackBuffer insertion operator for DataStrategy.
- **MPIUnpackBuffer & operator>>** (**MPIUnpackBuffer** &s, **DataStrategy** &data)
MPIUnpackBuffer extraction operator for DataStrategy.
- **std::ostream & operator<<** (std::ostream &s, const **DataStrategy** &data)
std::ostream insertion operator for DataStrategy
- **MPIPackBuffer & operator<<** (**MPIPackBuffer** &s, const **DataVariables** &data)
MPIPackBuffer insertion operator for DataVariables.
- **MPIUnpackBuffer & operator>>** (**MPIUnpackBuffer** &s, **DataVariables** &data)
MPIUnpackBuffer extraction operator for DataVariables.
- **std::ostream & operator<<** (std::ostream &s, const **DataVariables** &data)
std::ostream insertion operator for DataVariables
- int **salinas_main** (int argc, char *argv[], MPI_Comm *comm)
subroutine interface to SALINAS simulation code
- int **dlsolver_option** (Opt_Info *)

- void [abort_handler](#) (int code)
global function which handles serial or parallel aborts
- RealVector const * **continuous_lower_bounds** (Optimizer1 *o)
- RealVector const * **continuous_upper_bounds** (Optimizer1 *o)

- void **get_npath** (int appdrive, std::string *pnpath)
- void **workdir_adjust** (const std::string &workdir)
- std::string **get_cwd** ()

Portability adapter for getcwd.

- void **putenv_impl** (const char *name_and_value)

Utility function from boost/test, not available in the DAKOTA snapshot.

- static HANDLE * **wait_setup** (std::map< pid_t, int > *M, size_t *pn)
- static int **wait_for_one** (size_t n, HANDLE *h, int req1, size_t *pi)
- static void **pid_botch** ()
- template<class ListT >
void **removeAt** (ListT &l, typename ListT::size_type index)
- Real **getdist** (const RealVector &x1, const RealVector &x2)
- Real **mindist** (const RealVector &x, const RealMatrix &xset, int except)
- Real **mindistindx** (const RealVector &x, const RealMatrix &xset, const IntArray &indx)
- Real **getRmax** (const RealMatrix &xset)
- ParallelLibrary **dummy_lib** ("dummy")

dummy ParallelLibrary object used for < mandatory reference initialization when < a real ParallelLibrary instance is < unavailable

- template<typename T >
T **abort_handler_t** (int code)
- int **start_grid_computing** (char *analysis_driver_script, char *params_file, char *results_file)
- int **stop_grid_computing** ()
- int **perform_analysis** (char *iteration_num)
- template<typename T >
string **asstring** (const T &val)

Creates a string from the argument val using an ostringstream.

- void **run_dakota_data** ()

Function to encapsulate the DAKOTA object instantiations for mode 2: direct Data class instantiation.

- **PACKBUF** (int, MPI_INT)
- **UNPACKBUF** (int, MPI_INT)

- **PACKSIZE** (int, MPI_INT)
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const int &data)
insert an int
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const u_int &data)
insert a u_int
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const long &data)
insert a long
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const u_long &data)
insert a u_long
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const short &data)
insert a short
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const u_short &data)
insert a u_short
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const char &data)
insert a char
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const u_char &data)
insert a u_char
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const double &data)
insert a double
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const float &data)
insert a float
- **MPIPackBuffer & operator<<** (MPIPackBuffer &buff, const bool &data)
insert a bool
- **MPIUnpackBuffer & operator>>** (MPIUnpackBuffer &buff, int &data)
extract an int
- **MPIUnpackBuffer & operator>>** (MPIUnpackBuffer &buff, u_int &data)
extract a u_int
- **MPIUnpackBuffer & operator>>** (MPIUnpackBuffer &buff, long &data)
extract a long
- **MPIUnpackBuffer & operator>>** (MPIUnpackBuffer &buff, u_long &data)
extract a u_long

- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, short &data`)

extract a short
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, u_short &data`)

extract a u_short
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, char &data`)

extract a char
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, u_char &data`)

extract a u_char
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, double &data`)

extract a double
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, float &data`)

extract a float
- **`MPIUnpackBuffer & operator>>`** (`MPIUnpackBuffer &buff, bool &data`)

extract a bool
- template<class ContainerT >

void `container_read` (ContainerT &c, `MPIUnpackBuffer &s`)

Read a generic container (vector<T>, list<T>) from `MPIUnpackBuffer`, s.
- template<class ContainerT >

void `container_write` (const ContainerT &c, `MPIPackBuffer &s`)

Write a generic container to `MPIPackBuffer`, s.
- template<class ContainerT >

`MPIUnpackBuffer & operator>>` (`MPIUnpackBuffer &s, ContainerT &data`)

global `MPIUnpackBuffer` extraction operator for generic container
- template<class ContainerT >

`MPIPackBuffer & operator<<` (`MPIPackBuffer &s, const ContainerT &data`)

global `MPIPackBuffer` insertion operator for generic container
- int `MPIPackSize` (const int &data, const int num=1)

return packed size of an int
- int `MPIPackSize` (const u_int &data, const int num=1)

return packed size of a u_int
- int `MPIPackSize` (const long &data, const int num=1)

return packed size of a long

- int **MPIPackSize** (const u_long &data, const int num=1)
return packed size of a u_long
- int **MPIPackSize** (const short &data, const int num=1)
return packed size of a short
- int **MPIPackSize** (const u_short &data, const int num=1)
return packed size of a u_short
- int **MPIPackSize** (const char &data, const int num=1)
return packed size of a char
- int **MPIPackSize** (const u_char &data, const int num=1)
return packed size of a u_char
- int **MPIPackSize** (const double &data, const int num=1)
return packed size of a double
- int **MPIPackSize** (const float &data, const int num=1)
return packed size of a float
- int **MPIPackSize** (const bool &data, const int num=1)
return packed size of a bool
- int **nidr_parse** (const char *, FILE *)
- int **not_executable** (const char *driver_name, const char *tdir)
- static void **scale_chk** (StringArray &ST, RealVector &S, const char *what, const char **univ)

- std::istream & **operator>>** (std::istream &s, *ParamResponsePair* &pair)

std::istream extraction operator for ParamResponsePair
- std::ostream & **operator<<** (std::ostream &s, const *ParamResponsePair* &pair)

std::ostream insertion operator for ParamResponsePair
- **BiStream & operator>>** (*BiStream* &s, *ParamResponsePair* &pair)

BiStream extraction operator for ParamResponsePair.
- **BoStream & operator<<** (*BoStream* &s, const *ParamResponsePair* &pair)

BoStream insertion operator for ParamResponsePair.
- **MPIUnpackBuffer & operator>>** (*MPIUnpackBuffer* &s, *ParamResponsePair* &pair)

MPIUnpackBuffer extraction operator for ParamResponsePair.
- **MPIPackBuffer & operator<<** (*MPIPackBuffer* &s, const *ParamResponsePair* &pair)

MPIPackBuffer insertion operator for ParamResponsePair.
- bool **operator==** (const *ParamResponsePair* &pair1, const *ParamResponsePair* &pair2)

equality operator for ParamResponsePair
- bool **operator!=** (const *ParamResponsePair* &pair1, const *ParamResponsePair* &pair2)

inequality operator for ParamResponsePair
- static void * **binsearch** (void *kw, size_t kwsizze, size_t n, const char *key)
- static const char * **Begins** (const *String* &entry_name, const char *s)
- static void **Bad_name** (*String* entry_name, const char *where)
- static void **Locked_db** ()
- static void **Null_rep** (const char *who)
- static void **Null_rep1** (const char *who)
- bool **set_compare** (const *ParamResponsePair* &database_pr, const *ActiveSet* &search_set)

search function for a particular ParamResponsePair within a PRPList based on ActiveSet content (request vector and derivative variables vector)
- bool **id_vars_exact_compare** (const *ParamResponsePair* &database_pr, const *ParamResponsePair* &search_pr)

search function for a particular ParamResponsePair within a PRPMultiIndex
- std::size_t **hash_value** (const *ParamResponsePair* &prp)

hash_value for ParamResponsePairs stored in a PRPMultiIndex

- PRPCacheHIter **hashedCacheBegin** (PRPCache &prp_cache)
hashed definition of cache begin
- PRPCacheHIter **hashedCacheEnd** (PRPCache &prp_cache)
hashed definition of cache end
- PRPQueueHIter **hashedQueueBegin** (PRPQueue &prp_queue)
hashed definition of queue begin
- PRPQueueHIter **hashedQueueEnd** (PRPQueue &prp_queue)
hashed definition of queue end
- PRPCacheHIter **lookup_by_val** (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr)
find a ParamResponsePair based on the interface id, variables, and ActiveSet search data within search_pr.
- bool **lookup_by_val** (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)
alternate overloaded form returns bool and sets found_pr by wrapping lookup_by_val(PRPMultiIndexCache&, ParamResponsePair&)
- PRPCacheHIter **lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set)
find the evaluation id of a ParamResponsePair within a PRPMultiIndexCache based on interface id, variables, and ActiveSet search data
- bool **lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, ParamResponsePair &found_pr)
find a ParamResponsePair within a PRPMultiIndexCache based on interface id, variables, and ActiveSet search data
- bool **lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, int &found_eval_id)
find the evaluation id of a ParamResponsePair within a PRPMultiIndexCache based on interface id, variables, and ActiveSet search data
- bool **lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, Response &found_resp)
find the response of a ParamResponsePair within a PRPMultiIndexCache based on interface id, variables, and ActiveSet search data
- PRPCacheOIter **lookup_by_ids** (PRPMultiIndexCache &prp_cache, const IntStringPair &search_ids)
find a ParamResponsePair within a PRPMultiIndexCache based on search_ids (i.e. std::pair<eval_id,interface_id>) search data

- `bool lookup_by_ids (PRPMultiIndexCache &prp_cache, const IntStringPair &search_eval_interface_ids, ParamResponsePair &found_pr)`
find a `ParamResponsePair` within a `PRPMultiIndexCache` based on `eval_interface_ids`
- `bool lookup_by_ids (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)`
find a `ParamResponsePair` within a `PRPMultiIndexCache` based on `eval_interface_ids` from the `ParamResponsePair` search data
- PRPQueueHIter `lookup_by_val (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr)`
find a `ParamResponsePair` based on the interface id, variables, and `ActiveSet` search data within `search_pr`.
- `bool lookup_by_val (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)`
alternate overloaded form returns bool and sets `found_pr` by wrapping `lookup_by_val(PRPMultiIndexQueue&, ParamResponsePair&)`
- PRPQueueHIter `lookup_by_val (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set)`
find the evaluation id of a `ParamResponsePair` within a `PRPMultiIndexQueue` based on interface id, variables, and `ActiveSet` search data
- `bool lookup_by_val (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, ParamResponsePair &found_pr)`
find a `ParamResponsePair` within a `PRPMultiIndexQueue` based on interface id, variables, and `ActiveSet` search data
- `bool lookup_by_val (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, int &found_eval_id)`
find the evaluation id of a `ParamResponsePair` within a `PRPMultiIndexQueue` based on interface id, variables, and `ActiveSet` search data
- `bool lookup_by_val (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, Response &found_resp)`
find the response of a `ParamResponsePair` within a `PRPMultiIndexQueue` based on interface id, variables, and `ActiveSet` search data
- PRPQueueOIter `lookup_by_eval_id (PRPMultiIndexQueue &prp_queue, const int &search_id)`
find a `ParamResponsePair` within a `PRPMultiIndexQueue` based on `search_id` (i.e. integer `eval_id`) search data
- `bool lookup_by_eval_id (PRPMultiIndexQueue &prp_queue, const int &search_id, ParamResponsePair &found_pr)`
find a `ParamResponsePair` within a `PRPMultiIndexQueue` based on `eval_id`
- `bool lookup_by_eval_id (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)`

find a `ParamResponsePair` within a `PRPMultiIndexQueue` based on eval_id from the `ParamResponsePair` search data

- void `print_restart` (int argc, char **argv, **String** print_dest)
print a restart file
- void `print_restart_tabular` (int argc, char **argv, **String** print_dest)
print a restart file (tabular format)
- void `read_neutral` (int argc, char **argv)
read a restart file (neutral file format)
- void `repair_restart` (int argc, char **argv, **String** identifier_type)
repair a restart file by removing corrupted evaluations
- void `concatenate_restart` (int argc, char **argv)
concatenate multiple restart files
- void `find_env_token` (const char *s0, const char **s1, const char **s2, const char **s3)
- const char ** `arg_list_adjust` (const char **, void **)
Utility function from legacy, "not_executable" module -- DO NOT TOUCH!
- bool `path_is_absolute` (const bfs::path &p)
Utilities to manage API differences in BFS_VERSION_2 vs BFS_VERSION_3.
- std::string `filename` (const bfs::path &file_path)
Same as file_path.filename() in latest boost::filesystem.
- bfs::path `parent_path` (const bfs::path &fp)
Should be same as fp.parent_path() in latest boost::filesystem.
- bool `contains` (const bfs::path &dir_path, const std::string &file_name, boost::filesystem::path &complete_filepath)
Helper for "which" - sets complete_filepath from dir_path/file_name combo.

Variables

- **ParallelLibrary** * `Dak_pl`
set by `ParallelLibrary`, for use in CLH
- **ProblemDescDB** `dummy_db`
dummy `ProblemDescDB` object used for < mandatory reference initialization when a < real `ProblemDescDB` instance is unavailable
- **ParallelLibrary** `dummy_lib`

dummy [ParallelLibrary](#) object used for < mandatory reference initialization when < a real [ParallelLibrary](#) instance is < unavailable

- [Graphics dakota_graphics](#)

the global [Dakota::Graphics](#) object used by < strategies, models, and approximations

- [Interface dummy_interface](#)

dummy [Interface](#) object used for mandatory < reference initialization or default virtual < function return by reference when a real < [Interface](#) instance is unavailable

- [Model dummy_model](#)

dummy [Model](#) object used for mandatory reference < initialization or default virtual function < return by reference when a real [Model](#) instance < is unavailable

- [Iterator dummy_iterator](#)

dummy [Iterator](#) object used for mandatory < reference initialization or default virtual < function return by reference when a real < [Iterator](#) instance is unavailable

- const char * [FIELD_NAMES](#) []

- const int [NUMBER_OF_FIELDS](#) = 25

- PRPCache [data_pairs](#)

contains all parameter/response pairs.

- [Dakota_funcs * DF](#)

- [Dakota_funcs DakFuncs0](#)

- static time_t [start_time](#)

- static int [dakdrive](#)

- static char [slmap](#) [256]

- std::ostream * [dakota_cout](#) = &cout

DAKOTA stdout initially points to cout, < but may be redirected to a tagged ostream if < there are concurrent iterators.

- std::ostream * [dakota_cerr](#) = &cerr

DAKOTA stderr initially points to cerr, < but may be redirected to a tagged ostream if < there are concurrent iterators.

- [BoStream write_restart](#)

the restart binary output stream (doesn't < really need to be global anymore except for < [abort_handler\(\)](#)).

- int [write_precision](#) = 10

used in ostream data output functions < ([restart_util.C](#) overrides this default value)

- int [mc_ptr_int](#) = 0

global pointer for ModelCenter API

- int [dc_ptr_int](#) = 0

global pointer for ModelCenter eval DB

- **ProblemDescDB * Dak_pddb**

set by [ProblemDescDB](#), for use in parsing

- **const size_t _NPOS = ~(size_t)0**

special value returned by [index\(\)](#) when entry not found

a (perhaps arbitrary) definition of large scale; choose a large-scale algorithm if numVars >= LARGE_SCALE

42.1.1 Detailed Description

The primary namespace for DAKOTA. Utility functions for reading and writing tabular data files.

The [COLINOptimizer](#) class wraps COLIN, a Sandia-developed C++ optimization interface library. A variety of COLIN optimizers are defined in COLIN and its associated libraries, including SCOLIB which contains the optimization components from the old COLINY (formerly SGOPT) library. COLIN contains optimizers such as genetic algorithms, pattern search methods, and other nongradient-based techniques. [COLINOptimizer](#) uses a [COLINAApplication](#) object to perform the function evaluations.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, and `solution_accuracy` are mapped into COLIN's `max_iterations`, `max_function_evaluations_this_trial`, `function_value_tolerance`, `sufficient_objective_value` properties. An `outputLevel` is mapped to COLIN's `output_level` property and a setting of `debug` activates output of method initialization and sets the COLIN `debug` attribute to 10000 for the `DEBUG` output level. Refer to [Hart, W.E., 2006] for additional information on COLIN objects and controls.

The [Dakota](#) namespace encapsulates the core classes of the DAKOTA framework and prevents name clashes with third-party libraries from methods and packages. The C++ source files defining these core classes reside in Dakota/src as *.[CH].

Emerging utilities for tabular file I/O. For now, just extraction of capability from separate contexts to facilitate rework. These augment (and leverage) those in `data_util.h`

Design/capability goals: Ability to read / write data with row/col headers or in free-form Detect premature end of file, report if extra data More consistent and reliable checks for file open errors Require right number of cols in header mode; only total data checking in free-form (likely) Allow comment character for header rows or even in data? variables vs. variables/responses for both read and write Should we support CSV? delimiter = ','; other? Verify treatment of trailing newline without reading a zero Allow reading into the transpose of the data structure

42.1.2 Typedef Documentation

- 42.1.2.1 **typedef bmi::multi_index_container<Dakota::ParamResponsePair,
bmi::indexed_by< bmi::ordered_unique<bmi::tag<ordered>,>
bmi::const_mem_fun<Dakota::ParamResponsePair, const IntStringPair&,>
&Dakota::ParamResponsePair::eval_interface_ids> >, bmi::hashed_non_-
unique<bmi::tag<hashed>,> bmi::identity<Dakota::ParamResponsePair>,>
partial_prp_hash,>> PRPMultiIndexCache**

Boost Multi-Index Container for globally caching ParamResponsePairs. For a global cache, both evaluation and interface id's are used for tagging [ParamResponsePair](#) records.

```
42.1.2.2 typedef bmi::multi_index_container<Dakota::ParamResponsePair,
bmi::indexed_by< bmi::ordered_unique<bmi::tag<ordered>, bmi::const_mem_-
fun<Dakota::ParamResponsePair, int, &Dakota::ParamResponsePair::eval_id>>,
bmi::hashed_non_unique<bmi::tag<hashed>, bmi::identity<Dakota::ParamResponsePair>,
partial_prp_hash, partial_prp_equality> >> PRPMultiIndexQueue
```

Boost Multi-Index Container for locally queueing ParamResponsePairs. For a local queue, interface id's are expected to be consistent, such that evaluation id's are sufficient for tracking particular evaluations.

42.1.3 Function Documentation

42.1.3.1 CommandShell & flush (CommandShell & *shell*)

convenient shell manipulator function to "flush" the shell global convenience function for manipulating the shell; invokes the class member flush function.

Referenced by SysCallAnalysisCode::spawn_analysis(), SysCallAnalysisCode::spawn_evaluation(), SysCallAnalysisCode::spawn_input_filter(), and SysCallAnalysisCode::spawn_output_filter().

42.1.3.2 Real Dakota::rel_change_rv (const RealVector & *curr_rv*, const RealVector & *prev_rv*) [inline]

Computes relative change between successive RealVectors using Euclidean norm. Removes the first instance matching object a from the list (and therefore differs from the STL list::remove() which removes all instances). Uses the STL find() algorithm to find the object and the list.erase() method to perform the remove.// WJB: Only used in ProblemDescDB.C! template <class listt>=""> void remove(ListT& l, typename ListT::value_type a) { typename ListT::iterator it = std::find(l.begin(), l.end(), a); if (it != l.end()) { l.erase(it); } }

Referenced by EffGlobalMinimizer::minimize_surrogates_on_model(), and NonDGlobalInterval::post_process_gp_results().

42.1.3.3 void start_dakota_heartbeat (int)

Heartbeat function provided by not_executable.C; pass output interval in seconds, or -1 to use \$DAKOTA_HEARTBEAT

Referenced by ParallelLibrary::init_mpi_comm(), and ParallelLibrary::ParallelLibrary().

42.1.3.4 int Dakota::my_cp (const char * *file*, const struct stat * *sb*, int *ftype*, int *depth*, void * *v*)

my_cp is a wrapper around 'cp -r'. The extra layer allows for symlink to be used instead of file copy.

42.1.3.5 void Dakota::get_npath (int *appdrive*, std::string * *pnpnpath*)

get_npath "shuffles" the string representing the current \$PATH variable definition so that '.' is first in the \$PATH. It then returns the new string as the result (last arg in the call).

References get_cwd().

42.1.3.6 std::string get_cwd ()

Portability adapter for getcwd. Portability adapter for getcwd

Referenced by get_npath().

42.1.3.7 Real Dakota::getdist (const RealVector & *x1*, const RealVector & *x2*)

Gets the Euclidean distance between *x1* and *x2*

Referenced by mindist(), and mindistindx().

42.1.3.8 Real Dakota::mindist (const RealVector & *x*, const RealMatrix & *xset*, int *except*)

Returns the minimum distance between the point *x* and the points in the set *xset* (compares against all points in *xset* except point "except"): if *except* is not needed, pass 0.

References getdist().

Referenced by getRmax().

42.1.3.9 Real Dakota::mindistindx (const RealVector & *x*, const RealMatrix & *xset*, const IntArray & *indx*)

Gets the min distance between *x* and points in the set *xset* defined by the *nidx* values in *indx*.

References getdist().

Referenced by GaussProcApproximation::pointsel_add_sel().

42.1.3.10 Real Dakota::getRmax (const RealMatrix & *xset*)

Gets the maximum of the min distance between each point and the rest of the set.

References mindist().

Referenced by GaussProcApproximation::pointsel_add_sel().

42.1.3.11 T Dakota::abort_handler_t (int *code*) [inline]

Templated abort_handler_t method that allows for convenient return from methods that otherwise have no sensible return from error clauses. Usage: MyType& method() { return abort_handler<MyType&>(-1); }

References abort_handler().

42.1.3.12 int Dakota::start_grid_computing (char * *analysis_driver_script*, char * *params_file*, char * *results_file*)

sample function prototype for launching grid computing

42.1.3.13 int Dakota::stop_grid_computing ()

sample function prototype for terminating grid computing

42.1.3.14 int Dakota::perform_analysis (char * iteration_num)

sample function prototype for submitting a grid evaluation

References SysCallAnalysisCode::spawn_evaluation().

42.1.3.15 string Dakota::asstring (const T & val) [inline]

Creates a string from the argument *val* using an ostringstream. This only gets used in this file and is only ever called with ints so no error checking is in place.

Parameters:

val The value of type T to convert to a string.

Returns:

The string representation of *val* created using an ostringstream.

Referenced by JEGAOptimizer::LoadTheConstraints(), and JEGAOptimizer::LoadTheObjectiveFunctions().

42.1.3.16 void run_dakota_data ()

Function to encapsulate the DAKOTA object instantiations for mode 2: direct Data class instantiation. Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

References ProblemDescDB::broadcast(), ProblemDescDB::check_input(), DataInterface::dataIfaceRep, DataMethod::dataMethodRep, DataResponses::dataRespRep, DataVariables::dataVarsRep, DataResponsesRep::gradientType, DataResponsesRep::hessianType, ProblemDescDB::insert_node(), ProblemDescDB::lock(), DataMethodRep::methodName, model_interface_plugins(), ParallelLibrary::mpirun_flag(), DataVariablesRep::numContinuousDesVars, DataResponsesRep::numNonlinearIneqConstraints, DataResponsesRep::numObjectiveFunctions, ProblemDescDB::post_process(), Strategy::run_strategy(), and ParallelLibrary::world_rank().

Referenced by main().

42.1.3.17 bool Dakota::set_compare (const ParamResponsePair & database_pr, const ActiveSet & search_set) [inline]

search function for a particular ParamResponsePair within a PRPList based on ActiveSet content (request vector and derivative variables vector) a global function to compare the ActiveSet of a particular database_pr (presumed to be in the global history list) with a passed in ActiveSet (search_set).

References ParamResponsePair::active_set(), ActiveSet::derivative_vector(), and ActiveSet::request_vector().

Referenced by lookup_by_val().

42.1.3.18 bool Dakota::id_vars_exact_compare (const ParamResponsePair & *database_pr*, const ParamResponsePair & *search_pr*) [inline]

search function for a particular [ParamResponsePair](#) within a PRPMultiIndex a global function to compare the interface id and variables of a particular database_pr (presumed to be in the global history list) with a passed in key of interface id and variables provided by search_pr.

References [binary_equal_to\(\)](#), [ParamResponsePair::interface_id\(\)](#), and [ParamResponsePair::prp_parameters\(\)](#).

Referenced by [partial_prp_equality::operator\(\)](#).

42.1.3.19 PRPCacheHIter Dakota::lookup_by_val (PRPMultiIndexCache & *prp_cache*, const ParamResponsePair & *search_pr*) [inline]

find a [ParamResponsePair](#) based on the interface id, variables, and [ActiveSet](#) search data within search_pr. Lookup occurs in two steps: (1) PRPMultiIndexCache lookup based on strict equality in interface id and variables, and (2) [set_compare\(\)](#) post-processing based on [ActiveSet](#) subset logic.

References [ParamResponsePair::active_set\(\)](#), and [set_compare\(\)](#).

Referenced by [ApplicationInterface::duplication_detect\(\)](#), [Model::estimate_derivatives\(\)](#), [SurrBasedLocalMinimizer::find_center_approx\(\)](#), [Optimizer::local_objective_recast_retrieve\(\)](#), [lookup_by_val\(\)](#), [SNLLLeastSq::post_run\(\)](#), [COLINOptimizer::post_run\(\)](#), [SurrBasedMinimizer::print_results\(\)](#), [Optimizer::print_results\(\)](#), [LeastSq::print_results\(\)](#), [DiscrepancyCorrection::search_db\(\)](#), and [NonDLocalReliability::update_mpp_search_data\(\)](#).

42.1.3.20 PRPQueueHIter Dakota::lookup_by_val (PRPMultiIndexQueue & *prp_queue*, const ParamResponsePair & *search_pr*) [inline]

find a [ParamResponsePair](#) based on the interface id, variables, and [ActiveSet](#) search data within search_pr. Lookup occurs in two steps: (1) PRPMultiIndexQueue lookup based on strict equality in interface id and variables, and (2) [set_compare\(\)](#) post-processing based on [ActiveSet](#) subset logic.

References [ParamResponsePair::active_set\(\)](#), and [set_compare\(\)](#).

42.1.3.21 void print_restart (int *argc*, char ** *argv*, String *print_dest*)

print a restart file **Usage:** "dakota_restart_util print dakota.rst"

"dakota_restart_util to_neutral dakota.rst dakota.neu"

Prints all evals. in full precision to either stdout or a neutral file. The former is useful for ensuring that duplicate detection is successful in a restarted run (e.g., starting a new method from the previous best), and the latter is used for translating binary files between platforms.

References [ParamResponsePair::eval_id\(\)](#), [ParamResponsePair::write_annotated\(\)](#), and [write_precision](#).

Referenced by [main\(\)](#).

42.1.3.22 void print_restart_tabular (int argc, char ** argv, String print_dest)

print a restart file (tabular format) **Usage:** "dakota_restart_util to_pdb dakota.rst dakota.pdb"
"dakota_restart_util to_tabular dakota.rst dakota.txt"

Unrolls all data associated with a particular tag for all evaluations and then writes this data in a tabular format (e.g., to a PDB database or MATLAB/TECPLOT data file).

References Variables::continuous_variables(), String::data(), data_pairs, Variables::discrete_int_variables(), Variables::discrete_real_variables(), and Response::function_values().

Referenced by main().

42.1.3.23 void read_neutral (int argc, char ** argv)

read a restart file (neutral file format) **Usage:** "dakota_restart_util from_neutral dakota.neu dakota.rst"

Reads evaluations from a neutral file. This is used for translating binary files between platforms.

References ParamResponsePair::read_annotated(), and write_restart.

Referenced by main().

42.1.3.24 void repair_restart (int argc, char ** argv, String identifier_type)

repair a restart file by removing corrupted evaluations **Usage:** "dakota_restart_util remove 0.0 dakota_old.rst dakota_new.rst"
"dakota_restart_util remove_ids 2 7 13 dakota_old.rst dakota_new.rst"

Repairs a restart file by removing corrupted evaluations. The identifier for evaluation removal can be either a double precision number (all evaluations having a matching response function value are removed) or a list of integers (all evaluations with matching evaluation ids are removed).

References Response::active_set_request_vector(), contains(), ParamResponsePair::eval_id(), Response::function_values(), ParamResponsePair::prp_response(), and write_restart.

Referenced by main().

42.1.3.25 void concatenate_restart (int argc, char ** argv)

concatenate multiple restart files **Usage:** "dakota_restart_util cat dakota_1.rst ... dakota_n.rst dakota_new.rst"

Combines multiple restart files into a single restart database.

References write_restart.

Referenced by main().

42.1.3.26 bool Dakota::path_is_absolute (const bfs::path & p) [inline]

Utilities to manage API differences in BFS_VERSION_2 vs BFS_VERSION_3. Same as path.is_absolute() in latest boost::filesystem

42.1.4 Variable Documentation

42.2 SIM Namespace Reference

A sample namespace for derived classes that use `assign_rep()` to plug facilities into DAKOTA.

Classes

- class [ParallelDirectApplicInterface](#)

Sample derived interface class for testing parallel simulator plug-ins using `assign_rep()`.

- class [SerialDirectApplicInterface](#)

Sample derived interface class for testing serial simulator plug-ins using `assign_rep()`.

42.2.1 Detailed Description

A sample namespace for derived classes that use `assign_rep()` to plug facilities into DAKOTA. A typical use of plug-ins with `assign_rep()` is to publish a simulation interface for use in library mode. See [Interfacing with DAKOTA as a Library](#) for more information.

Chapter 43

Class Documentation

43.1 ActiveSet Class Reference

Container class for active set tracking information. Contains the active set request vector and the derivative variables vector.

Public Member Functions

- `ActiveSet ()`
default constructor
- `ActiveSet (size_t num_fns, size_t num_deriv_vars)`
standard constructor
- `ActiveSet (size_t num_fns)`
partial constructor
- `ActiveSet (const ActiveSet &set)`
copy constructor
- `~ActiveSet ()`
destructor
- `ActiveSet & operator= (const ActiveSet &set)`
assignment operator
- `void reshape (size_t num_fns, size_t num_deriv_vars)`
reshape requestVector and derivVarsVector
- `void reshape (size_t num_fns)`
reshape requestVector

- `const ShortArray & request_vector () const`
return the request vector
- `void request_vector (const ShortArray &rv)`
set the request vector
- `void request_values (const short rv_val)`
set all request vector values
- `short request_value (const size_t index) const`
get the value of an entry in the request vector
- `void request_value (const short rv_val, const size_t index)`
set the value of an entry in the request vector
- `const SizetArray & derivative_vector () const`
return the derivative variables vector
- `void derivative_vector (const SizetArray &dvv)`
set the derivative variables vector from a SizetArray
- `void derivative_vector (SizetMultiArrayConstView dvv)`
set the derivative variables vector from a SizetMultiArrayConstView
- `void derivative_start_value (size_t dvv_start_val)`
set the derivative variables vector values
- `void read (std::istream &s)`
read an active set object from an std::istream
- `void write (std::ostream &s) const`
write an active set object to an std::ostream
- `void write_annotated (std::ostream &s) const`
write an active set object to an std::ostream in annotated format
- `void read (BiStream &s)`
read an active set object from the binary restart stream
- `void write (BoStream &s) const`
write an active set object to the binary restart stream
- `void read (MPIUnpackBuffer &s)`
read an active set object from a packed MPI buffer

- void `write (MPIPackBuffer &s) const`
write an active set object to a packed MPI buffer

Private Attributes

- ShortArray `requestVector`
the vector of response requests
- SizetArray `derivVarsVector`
the vector of variable ids used for computing derivatives

Friends

- bool `operator== (const ActiveSet &set1, const ActiveSet &set2)`
equality operator
- bool `operator!= (const ActiveSet &set1, const ActiveSet &set2)`
inequality operator

43.1.1 Detailed Description

Container class for active set tracking information. Contains the active set request vector and the derivative variables vector. The `ActiveSet` class is a small class whose initial design function is to avoid having to pass the ASV and DVV separately. It is not part of a class hierarchy and does not employ reference-counting/ representation-sharing idioms (e.g., handle-body).

43.1.2 Member Data Documentation

43.1.2.1 ShortArray `requestVector` [private]

the vector of response requests It uses a 0 value for inactive functions and sums 1 (value), 2 (gradient), and 4 (Hessian) for active functions.

Referenced by `ActiveSet::ActiveSet()`, `ActiveSet::operator=()`, `Dakota::operator==()`, `ActiveSet::read()`, `ActiveSet::request_value()`, `ActiveSet::request_values()`, `ActiveSet::request_vector()`, `ActiveSet::reshape()`, `ActiveSet::write()`, and `ActiveSet::write_annotated()`.

43.1.2.2 SizetArray `derivVarsVector` [private]

the vector of variable ids used for computing derivatives These ids will generally identify either the active continuous variables or the inactive continuous variables.

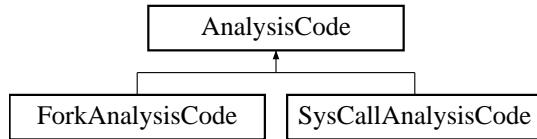

Referenced by ActiveSet::ActiveSet(), ActiveSet::derivative_start_value(), ActiveSet::derivative_vector(), ActiveSet::operator=(), Dakota::operator==(), ActiveSet::read(), ActiveSet::reshape(), ActiveSet::write(), and ActiveSet::write_annotated().

The documentation for this class was generated from the following files:

- DakotaActiveSet.H
- DakotaActiveSet.C

43.2 AnalysisCode Class Reference

Base class providing common functionality for derived classes ([SysCallAnalysisCode](#) and [ForkAnalysisCode](#)) which spawn separate processes for managing simulations. Inheritance diagram for AnalysisCode::

Public Member Functions

- void [define_filenames](#) (const int id)
define modified filenames from user input by handling Unix temp file and tagging options
- void [write_parameters_files](#) (const [Variables](#) &vars, const [ActiveSet](#) &set, const [Response](#) &response, const int id)
write the parameters data and response request data to one or more parameters files (using one or more invocations of [write_parameters_file\(\)](#)) in either standard or aprepro format
- void [read_results_files](#) ([Response](#) &response, const int id)
read the response object from one or more results files
- const std::vector< [String](#) > & [program_names](#) () const
return programNames
- const std::string & [input_filter_name](#) () const
return iFilterName
- const std::string & [output_filter_name](#) () const
return oFilterName
- const std::string & [parameters_filename](#) () const
return paramsFileName
- const std::string & [results_filename](#) () const
return resultsFileName
- const std::string & [results_filename](#) (const int id)
return the results filename entry in fileNameMap corresponding to id
- void [suppress_output_flag](#) (const bool flag)
set suppressOutputFlag

- bool `suppress_output_flag () const`
return suppressOutputFlag
- bool `command_line_arguments () const`
return commandLineArgs
- bool `multiple_parameters_filenames () const`
return multipleParamsFiles
- void `file_cleanup () const`
remove temporary files if not fileSaveFlag

Protected Member Functions

- `AnalysisCode (const ProblemDescDB &problem_db)`
constructor
- `~AnalysisCode ()`
destructor
- const char * `work_dir () const`
return Workdir if useWorkdir is true (only called by derived classes)

Protected Attributes

- bool `suppressOutputFlag`
flag set by master processor to suppress output from slave processors
- short `outputLevel`
output verbosity level: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}_OUTPUT
- bool `fileTagFlag`
flags tagging of parameter/results files
- bool `fileSaveFlag`
flags retention of parameter/results files
- bool `commandLineArgs`
flag indicating use of passing of filenames as command line arguments to the analysis drivers and input/output filters
- bool `apreproFlag`
flag indicating use of the APREPRO (the Sandia "A PRE PROcessor" utility) format for parameter files

- bool **multipleParamsFiles**
flag indicating the need for separate parameters files for multiple analysis drivers
- std::string **iFilterName**
the name of the input filter (input_filter user specification)
- std::string **oFilterName**
the name of the output filter (output_filter user specification)
- std::vector< [String](#) > **programNames**
the names of the analysis code programs (analysis_drivers user specification)
- size_t **numPrograms**
the number of analysis code programs (length of programNames)
- std::string **specifiedParamsFileName**
the name of the parameters file from user specification
- std::string **paramsFileName**
the parameters file name actually used (modified with tagging or temp files)
- std::string **specifiedResultsFileName**
the name of the results file from user specification
- std::string **resultsFileName**
the results file name actually used (modified with tagging or temp files)
- bool **allowExistingResults**
by default analysis code interfaces delete results files if they exist; user may override with this flag and we'll try to gather and only fork if needed
- std::string **curWorkdir**
working directory when useWorkdir is true
- std::map< int, std::pair< std::string, std::string > > **fileNameMap**
stores parameters and results file names used in spawning function evaluations. Map key is the function evaluation identifier.
- bool **useWorkdir**
whether to use a new or specified work_directory
- std::string **workDir**
its name, if specified...
- bool **dirTag**

whether to tag the working directory

- bool **dirSave**
whether dir_save was specified
- bool **dirDel**
whether to delete the directory when Dakota terminates
- std::string **templateDir**
template directory (if specified)
- StringArray **templateFiles**
template files (if specified)
- bool **templateCopy**
whether to force a copy (versus link) every time
- bool **templateReplace**
whether to replace existing files
- bool **haveTemplateDir**
state variable for template directory
- bool **haveWorkdir**
for dirTag, whether we have workDir
- std::string **dakDir**
Dakota directory (if needed).

Private Member Functions

- void **write_parameters_file** (const **Variables** &vars, const **ActiveSet** &set, const **Response** &response, const std::string &prog, const std::vector<**String**> &an_comps, const std::string ¶ms_fname)
write the variables, active set vector, derivative variables vector, and analysis components to the specified parameters file in either standard or aprepro format

Private Attributes

- **ParallelLibrary** & parallelLib
reference to the ParallelLibrary object. Used in [define_filenames\(\)](#).
- String2DArray **analysisComponents**
the set of optional analysis components used by the analysis drivers (from the analysis_components interface specification)

43.2.1 Detailed Description

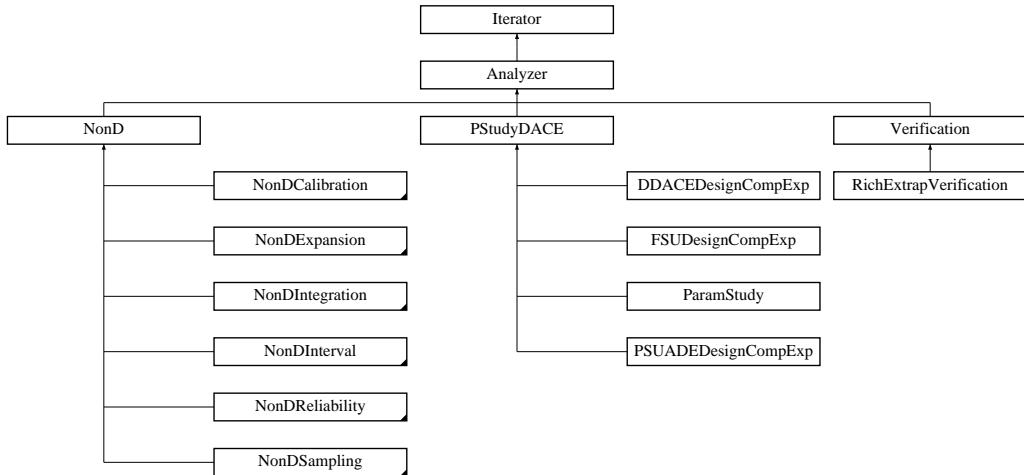

Base class providing common functionality for derived classes ([SysCallAnalysisCode](#) and [ForkAnalysisCode](#)) which spawn separate processes for managing simulations. The [AnalysisCode](#) class hierarchy provides simulation spawning services for [ApplicationInterface](#) derived classes and alleviates these classes of some of the specifics of simulation code management. The hierarchy does not employ the letter-envelope technique since the [ApplicationInterface](#) derived classes instantiate the appropriate derived [AnalysisCode](#) class directly.

The documentation for this class was generated from the following files:

- [AnalysisCode.H](#)
- [AnalysisCode.C](#)

43.3 Analyzer Class Reference

Base class for [NonD](#), [DACE](#), and [ParamStudy](#) branches of the iterator hierarchy. Inheritance diagram for Analyzer::

Public Member Functions

- const VariablesArray & [all_variables](#) ()
return the complete set of evaluated variables
- const RealMatrix & [all_samples](#) ()
return the complete set of evaluated samples
- const IntResponseMap & [all_responses](#) () const
return the complete set of computed responses
- virtual void [vary_pattern](#) (bool pattern_flag)
sets varyPattern in derived classes that support it

Protected Member Functions

- [Analyzer](#) ()
default constructor
- [Analyzer](#) ([Model](#) &model)
standard constructor
- [Analyzer](#) ([NoDBBaseConstructor](#), [Model](#) &model)

alternate constructor for instantiations "on the fly" with a Model

- [Analyzer \(NoDBBaseConstructor\)](#)

alternate constructor for instantiations "on the fly" without a Model

- [~Analyzer \(\)](#)

destructor

- virtual void [get_parameter_sets \(Model &model\)](#)

*Returns one block of samples (ndim * num_samples).*

- virtual void [update_model_from_sample \(Model &model, const Real *sample_vars\)](#)

update model's current variables with data from sample

- virtual void [update_model_from_variables \(Model &model, const Variables &vars\)](#)

update model's current variables with data from vars

- void [pre_output \(\)](#)

- void [print_results \(std::ostream &s\)](#)

print the final iterator results

- const [Variables & variables_results \(\) const](#)

return a single final iterator solution (variables)

- const [Response & response_results \(\) const](#)

return a single final iterator solution (response)

- const [VariablesArray & variables_array_results \(\)](#)

return multiple final iterator solutions (variables). This should only be used if returns_multiple_points() returns true.

- const [ResponseArray & response_array_results \(\)](#)

return multiple final iterator solutions (response). This should only be used if returns_multiple_points() returns true.

- void [response_results_active_set \(const ActiveSet &set\)](#)

set the requested data for the final iterator response results

- bool [compact_mode \(\) const](#)

returns Analyzer::compactMode

- bool [returns_multiple_points \(\) const](#)

indicates if this iterator returns multiple final points. Default return is false. Override to return true if appropriate.

- void [evaluate_parameter_sets \(Model &model, bool log_resp_flag, bool log_best_flag\)](#)

perform function evaluations to map parameter sets (allVariables) into response sets (allResponses)

- void `variance_based_decomp` (int ncont, int ndiscint, int ndiscreal, int num_samples)
 convenience function for reading variables/responses (used in derived classes post_input)
- void `read_variables_responses` (int num_evals, size_t num_vars)
Printing of VBD results.
- void `print_sobol_indices` (std::ostream &s) const
Printing of VBD results.
- void `sample_to_variables` (const Real *sample_c_vars, `Variables` &vars)
convert samples array to variables array; e.g., allSamples to allVariables
- void `samples_to_variables_array` (const RealMatrix &sample_matrix, `VariablesArray` &vars_array)
convert samples array to variables array; e.g., allSamples to allVariables
- void `variables_array_to_samples` (const `VariablesArray` &vars_array, RealMatrix &sample_matrix)
convert variables array to samples array; e.g., allVariables to allSamples

Protected Attributes

- bool `compactMode`
switch for allSamples (compact mode) instead of allVariables (normal mode)
- `VariablesArray` `allVariables`
array of all variables to be evaluated in evaluate_parameter_sets()
- `RealMatrix` `allSamples`
compact alternative to allVariables
- `IntResponseMap` `allResponses`
array of all responses to be computed in evaluate_parameter_sets()
- `StringArray` `allHeaders`
array of headers to insert into output while evaluating allVariables
- size_t `numObjFns`
number of objective functions
- size_t `numLSqTerms`
number of least squares terms
- `RealPairPRPMultiMap` `bestVarsRespMap`
map which stores best set of solutions

Private Member Functions

- void `compute_best_metrics` (const `Response` &response, std::pair< Real, Real > &metrics)
compares current evaluation to best evaluation and updates best
- void `update_best` (const `Variables` &vars, int eval_id, const `Response` &response)
compares current evaluation to best evaluation and updates best
- void `update_best` (const Real *sample_c_vars, int eval_id, const `Response` &response)
compares current evaluation to best evaluation and updates best

Private Attributes

- Real `vbdDropTol`
tolerance for omitting output of small VBD indices
- RealVectorArray `S4`
VBD main effect indices.
- RealVectorArray `T4`
VBD total effect indices.

43.3.1 Detailed Description

Base class for `NonD`, `DACE`, and `ParamStudy` branches of the iterator hierarchy. The `Analyzer` class provides common data and functionality for various types of systems analysis, including nondeterministic analysis, design of experiments, and parameter studies.

43.3.2 Member Function Documentation

43.3.2.1 void `pre_output()` [protected, virtual]

Generate tabular output with active variables (`compactMode`) or all variables with their labels and response labels, with no data. `Variables` are sequenced {cv, div, drv}

Reimplemented from `Iterator`.

References `Analyzer::allSamples`, `Analyzer::allVariables`, `ParallelLibrary::command_line_pre_run_output()`, `ParallelLibrary::command_line_user_modes()`, `Analyzer::compactMode`, `Model::current_response()`, `Model::current_variables()`, `Dakota::filename()`, `Iterator::iteratedModel`, `Iterator::outputLevel`, `Model::parallel_library()`, `Dakota::write_data_tabular()`, `Dakota::write_precision`, and `Iterator::writePrecision`.

43.3.2.2 void print_results (std::ostream & s) [protected, virtual]

print the final iterator results This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in [finalize_run\(\)](#).

Reimplemented from [Iterator](#).

Reimplemented in [PStudyDACE](#), [Verification](#), [NonDExpansion](#), [NonDGlobalReliability](#), [NonDGPMSABayesCalibration](#), [NonDIncremLHSSampling](#), [NonDInterval](#), [NonDLHSSampling](#), [NonDLocalReliability](#), and [RichExtrapVerification](#).

References [Analyzer::bestVarsRespMap](#), [ParamResponsePair::eval_id\(\)](#), [Response::function_values\(\)](#), [Analyzer::numLSqTerms](#), [Analyzer::numObjFns](#), [ParamResponsePair::prp_parameters\(\)](#), [ParamResponsePair::prp_response\(\)](#), and [Dakota::write_data_partial\(\)](#).

43.3.2.3 void evaluate_parameter_sets (Model & model, bool log_resp_flag, bool log_best_flag) [protected]

perform function evaluations to map parameter sets (allVariables) into response sets (allResponses) Convenience function for derived classes with sets of function evaluations to perform (e.g., [NonDSampling](#), [DDACEDEDesignCompExp](#), [FSUDesignCompExp](#), [ParamStudy](#)).

References [Iterator::activeSet](#), [Analyzer::allHeaders](#), [Analyzer::allResponses](#), [Analyzer::allSamples](#), [Analyzer::allVariables](#), [Model::asynch_compute_response\(\)](#), [Iterator::asynchFlag](#), [Analyzer::compactMode](#), [Model::compute_response\(\)](#), [Response::copy\(\)](#), [Model::current_response\(\)](#), [Model::current_variables\(\)](#), [Model::evaluation_id\(\)](#), [Model::synchronize\(\)](#), [Analyzer::update_best\(\)](#), [Analyzer::update_model_from_sample\(\)](#), and [Analyzer::update_model_from_variables\(\)](#).

43.3.2.4 void variance_based_decomp (int ncont, int ndiscint, int ndiscreal, int num_samples) [protected]

Calculation of sensitivity indices obtained by variance based decomposition. These indices are obtained by the Saltelli version of the Sobol VBD which uses $(K+2)*N$ function evaluations, where K is the number of dimensions (uncertain vars) and N is the number of samples.

References [Dakota::abort_handler\(\)](#), [Analyzer::allResponses](#), [Analyzer::allSamples](#), [Analyzer::allVariables](#), [Analyzer::compactMode](#), [Variables::continuous_variables\(\)](#), [Dakota::copy_data\(\)](#), [Variables::discrete_int_variables\(\)](#), [Variables::discrete_real_variables\(\)](#), [Analyzer::evaluate_parameter_sets\(\)](#), [Analyzer::get_parameter_sets\(\)](#), [Iterator::iteratedModel](#), [Iterator::numFunctions](#), [Analyzer::S4](#), [Analyzer::T4](#), and [Analyzer::vary_pattern\(\)](#).

43.3.2.5 void read_variables_responses (int *num_evals*, size_t *num_vars*) [protected]

convenience function for reading variables/responses (used in derived classes post_input) read num_evals variables/responses from file

References Dakota::abort_handler(), Analyzer::allResponses, Analyzer::allSamples, Analyzer::allVariables, ParallelLibrary::command_line_post_run_input(), ParallelLibrary::command_line_user_modes(), Analyzer::compactMode, Response::copy(), Variables::copy(), Model::current_response(), Model::current_variables(), Dakota::filename(), Iterator::iteratedModel, Iterator::outputLevel, Model::parallel_library(), and Analyzer::update_best().

Referenced by PSUADEDesignCompExp::post_input(), ParamStudy::post_input(), NonDLHSSampling::post_input(), FSUDesignCompExp::post_input(), and DDACEDESIGNCompExp::post_input().

43.3.2.6 void print_sobol_indices (std::ostream & *s*) const [protected]

Printing of VBD results. printing of variance based decomposition indices.

References Model::continuous_variable_labels(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), Iterator::iteratedModel, Iterator::numContinuousVars, Iterator::numDiscreteIntVars, Iterator::numDiscreteRealVars, Iterator::numFunctions, Model::response_labels(), Analyzer::S4, Analyzer::T4, Analyzer::vbdDropTol, and Dakota::write_precision.

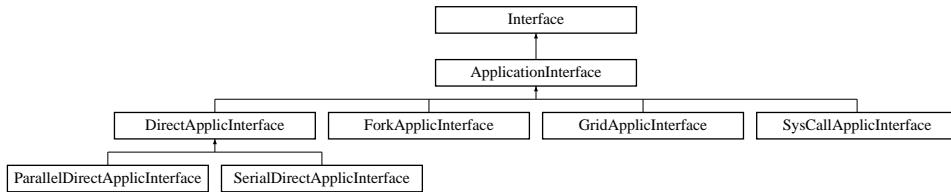

Referenced by NonDLHSSampling::print_results(), and PStudyDACE::print_results().

- DakotaAnalyzer.C

43.4 ApplicationInterface Class Reference

Derived class within the interface class hierarchy for supporting interfaces to simulation codes. Inheritance diagram for ApplicationInterface::

Public Member Functions

- [ApplicationInterface](#) (const ProblemDescDB &problem_db)
constructor
- [~ApplicationInterface](#) ()
destructor

Protected Member Functions

- void [init_communicators](#) (const IntArray &message_lengths, const int &max_iterator_concurrency)
allocate communicator partitions for concurrent evaluations within an iterator and concurrent multiprocessor analyses within an evaluation.
- void [set_communicators](#) (const IntArray &message_lengths)
set the local parallel partition data for an interface (the partitions are already allocated in [ParallelLibrary](#)).
- void [free_communicators](#) ()
deallocate communicator partitions for concurrent evaluations within an iterator and concurrent multiprocessor analyses within an evaluation.
- void [init_serial](#) ()
- int [asynch_local_evaluationConcurrency](#) () const
return asynchLocalEvalConcurrency
- [String interface_synchronization](#) () const
return interfaceSynchronization
- bool [evaluation_cache](#) () const
return evalCacheFlag

- void `map` (const `Variables` &vars, const `ActiveSet` &set, `Response` &response, const bool `asynch_flag=false`)
Provides a "mapping" of variables to responses using a simulation. Protected due to `Interface` letter-envelope idiom.
- void `manage_failure` (const `Variables` &vars, const `ActiveSet` &set, `Response` &response, int `failed_eval_id`)
manages a simulation failure using abort/retry/recover/continuation
- const `IntResponseMap` & `synch` ()
executes a blocking schedule for asynchronous evaluations in the `beforeSynchCorePRPQueue` and returns all jobs
- const `IntResponseMap` & `synch_nowait` ()
executes a nonblocking schedule for asynchronous evaluations in the `beforeSynchCorePRPQueue` and returns a partial set of completed jobs
- void `serve_evaluations` ()
run on evaluation servers to serve the iterator master
- void `stop_evaluation_servers` ()
used by the iterator master to terminate evaluation servers
- virtual void `derived_map` (const `Variables` &vars, const `ActiveSet` &set, `Response` &response, int `fn_eval_id`)
Called by `map()` and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.
- virtual void `derived_map_asynch` (const `ParamResponsePair` &pair)
Called by `map()` and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.
- virtual void `derived_synch` (`PRPQueue` &`prp_queue`)
For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.
- virtual void `derived_synch_nowait` (`PRPQueue` &`prp_queue`)
For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.
- void `self_schedule_analyses` ()
blocking self-schedule of all analyses within a function evaluation using message passing
- void `serve_analyses_synch` ()
serve the master analysis scheduler and manage one synchronous analysis job at a time
- virtual int `derived_synchronous_local_analysis` (const int &`analysis_id`)

Execute a particular analysis (identified by analysis_id) synchronously on the local processor. Used for the derived class specifics within [ApplicationInterface::serve_analyses_synch\(\)](#).

Protected Attributes

- **ParallelLibrary** & **parallelLib**
reference to the [ParallelLibrary](#) object used to manage MPI partitions for the concurrent evaluations and concurrent analyses parallelism levels
- **bool suppressOutput**
flag for suppressing output on slave processors
- **int evalCommSize**
size of evalComm
- **int evalCommRank**
processor rank within evalComm
- **int evalServerId**
evaluation server identifier
- **bool eaDedMasterFlag**
flag for dedicated master partitioning at ea level
- **int analysisCommSize**
size of analysisComm
- **int analysisCommRank**
processor rank within analysisComm
- **int analysisServerId**
analysis server identifier
- **int numAnalysisServers**
number of analysis servers
- **bool multiProcAnalysisFlag**
flag for multiprocessor analysis partitions
- **bool asynchLocalAnalysisFlag**
flag for asynchronous local parallelism of analyses
- **int asynchLocalAnalysisConcurrency**
limits the number of concurrent analyses in asynchronous local scheduling and specifies hybrid concurrency when message passing

- int **numAnalysisDrivers**
the number of analysis drivers used for each function evaluation (from the analysis_drivers interface specification)
- IntSet **completionSet**
the set of completed fn_eval_id's populated by derived_synch() and derived_synch_nowait()

Private Member Functions

- bool **duplication_detect** (const **Variables** &vars, **Response** &response, const bool asynch_flag)
checks data_pairs and beforeSynchCorePRPQueue to see if the current evaluation request has already been performed or queued
- void **self_schedule_evaluations** ()
blocking self-schedule of all evaluations in beforeSynchCorePRPQueue using message passing; executes on iteratorComm master
- void **static_schedule_evaluations** ()
blocking static schedule of all evaluations in beforeSynchCorePRPQueue using message passing; executes on iteratorComm master
- void **asynchronous_local_evaluations** (PRPQueue &prp_queue)
perform all jobs in prp_queue using asynchronous approaches on the local processor
- void **asynchronous_local_evaluations_static** (PRPQueue &prp_queue)
perform all the jobs in prp_queue using asynchronous approaches on the local processor, but schedule statically such that eval_id is always replaced with an equivalent one, modulo asynchLocalEvalConcurrency
- void **synchronous_local_evaluations** (PRPQueue &prp_queue)
perform all jobs in prp_queue using synchronous approaches on the local processor
- void **asynchronous_local_evaluations_nowait** (PRPQueue &prp_queue)
launch new jobs in prp_queue asynchronously (if capacity is available), perform nonblocking query of all running jobs, and process any completed jobs (handles both local self- and local static-scheduling cases)
- void **serve_evaluations_synch** ()
serve the evaluation message passing schedulers and perform one synchronous evaluation at a time
- void **serve_evaluations_asynch** ()
serve the evaluation message passing schedulers and manage multiple asynchronous evaluations
- void **serve_evaluations_peer** ()
serve the evaluation message passing schedulers and perform one synchronous evaluation at a time as part of the 1st peer

- void `set_evaluation_communicators` (const IntArray &message_lengths)
convenience function for updating the local evaluation partition data following `ParallelLibrary::init_evaluation_communicators()`.
- void `set_analysis_communicators` ()
convenience function for updating the local analysis partition data following `ParallelLibrary::init_analysis_communicators()`.
- void `check_configuration` (const int &max_iterator_concurrency)
perform some error checks on the parallel configuration
- const `ParamResponsePair` & `get_source_pair` (const `Variables` &target_vars)
convenience function for the continuation approach in `manage_failure()` for finding the nearest successful "source" evaluation to the failed "target"
- void `continuation` (const `Variables` &target_vars, const `ActiveSet` &set, `Response` &response, const `ParamResponsePair` &source_pair, int failed_eval_id)
performs a 0th order continuation method to step from a successful "source" evaluation to the failed "target". Invoked by `manage_failure()` for failAction == "continuation".
- void `common_input_filtering` (const `Variables` &vars)
common input filtering operations, e.g. mesh movement
- void `common_output_filtering` (`Response` &response)
common output filtering operations, e.g. data filtering

Private Attributes

- int `worldSize`
size of MPI_COMM_WORLD
- int `worldRank`
processor rank within MPI_COMM_WORLD
- int `iteratorCommSize`
size of iteratorComm
- int `iteratorCommRank`
processor rank within iteratorComm
- bool `ieMessagePass`
flag for message passing at ie scheduling level
- int `numEvalServers`
number of evaluation servers

- bool `eaMessagePass`
flag for message passing at ea scheduling level
- int `procsPerAnalysis`
processors per analysis servers
- int `lenVarsMessage`
length of a `MPIPackBuffer` containing a `Variables` object; computed in `Model::init_communicators()`
- int `lenVarsActSetMessage`
length of a `MPIPackBuffer` containing a `Variables` object and an `ActiveSet` object; computed in `Model::init_communicators()`
- int `lenResponseMessage`
length of a `MPIPackBuffer` containing a `Response` object; computed in `Model::init_communicators()`
- int `lenPRPairMessage`
length of a `MPIPackBuffer` containing a `ParamResponsePair` object; computed in `Model::init_communicators()`
- String `evalScheduling`
user specification of evaluation scheduling algorithm (self, static, or no spec). Used for manual overrides of the auto-configure logic in `ParallelLibrary::resolve_inputs()`.
- String `analysisScheduling`
user specification of analysis scheduling algorithm (self, static, or no spec). Used for manual overrides of the auto-configure logic in `ParallelLibrary::resolve_inputs()`.
- int `asynchLocalEvalConcurrency`
limits the number of concurrent evaluations in asynchronous local scheduling and specifies hybrid concurrency when message passing
- bool `asynchLocalEvalStatic`
whether the asynchronous local evaluations are to be performed with a static schedule (default false)
- IntArray `localServerJobMap`
array with one entry per local "server" indicating the job (`fn_eval_id`) currently running on the server (used for asynchronous local static schedules)
- String `interfaceSynchronization`
interface synchronization specification: synchronous (default) or asynchronous
- bool `headerFlag`
used by `synch_nowait` to manage output frequency (since this function may be called many times prior to any completions)
- bool `asvControlFlag`

used to manage a user request to deactivate the active set vector control. true = modify the ASV each evaluation as appropriate (default); false = ASV values are static so that the user need not check them on each evaluation.

- bool [evalCacheFlag](#)
used to manage a user request to deactivate the function evaluation cache (i.e., queries and insertions using the data_pairs cache).
- bool [restartFileFlag](#)
used to manage a user request to deactivate the restart file (i.e., insertions into write_restart).
- ShortArray [defaultASV](#)
the static ASV values used when the user has selected asvControl = off
- String [failAction](#)
mitigation action for captured simulation failures: abort, retry, recover, or continuation
- int [failRetryLimit](#)
limit on the number of retries for the retry failAction
- RealVector [failRecoveryFnVals](#)
the dummy function values used for the recover failAction
- IntResponseMap [historyDuplicateMap](#)
used to bookkeep asynchronous evaluations which duplicate data_pairs evaluations. Map key is evalIdCntr, map value is corresponding response.
- std::map< int, std::pair< PRPQueueHIter, Response > > [beforeSynchDuplicateMap](#)
used to bookkeep evalIdCntr, beforeSynchCorePRPQueue iterator, and response of asynchronous evaluations which duplicate queued beforeSynchCorePRPQueue evaluations
- PRPQueue [beforeSynchCorePRPQueue](#)
used to bookkeep vars/set/response of nonduplicate asynchronous core evaluations. This is the queue of jobs populated by asynchronous map() that is later scheduled in synch() or synch_nowait().
- PRPQueue [beforeSynchAlgPRPQueue](#)
used to bookkeep vars/set/response of asynchronous algebraic evaluations. This is the queue of algebraic jobs populated by asynchronous map() that is later evaluated in synch() or synch_nowait().
- IntSet [runningSet](#)
used by asynchronous_local_nowait to bookkeep which jobs are running

43.4.1 Detailed Description

Derived class within the interface class hierarchy for supporting interfaces to simulation codes. [ApplicationInterface](#) provides an interface class for performing parameter to response mappings using simulation code(s). It provides common functionality for a number of derived classes and contains the majority of all of the scheduling

algorithms in DAKOTA. The derived classes provide the specifics for managing code invocations using system calls, forks, direct procedure calls, or distributed resource facilities.

43.4.2 Member Function Documentation

43.4.2.1 void init_serial () [inline, protected, virtual]

DataInterface.C defaults of 0 servers are needed to distinguish an explicit user request for 1 server (serialization of a parallelism level) from no user request (use parallel auto-config). This default causes problems when [init_communicators\(\)](#) is not called for an interface object (e.g., static scheduling fails in [DirectApplicInterface::derived_map\(\)](#) for [NestedModel::optionalInterface](#)). This is the reason for this function: to reset certain defaults for interface objects that are used serially.

Reimplemented from [Interface](#).

References ApplicationInterface::numAnalysisServers, and ApplicationInterface::numEvalServers.

43.4.2.2 void map (const Variables & vars, const ActiveSet & set, Response & response, const bool asynch_flag = false) [protected, virtual]

Provides a "mapping" of variables to responses using a simulation. Protected due to [Interface](#) letter-envelope idiom. The function evaluator for application interfaces. Called from [derived_compute_response\(\)](#) and [derived_asynch_compute_response\(\)](#) in derived [Model](#) classes. If asynch_flag is not set, perform a blocking evaluation (using [derived_map\(\)](#)). If asynch_flag is set, add the job to the [beforeSynchCorePRPQueue](#) queue for execution by one of the scheduler routines in [synch\(\)](#) or [synch_nowait\(\)](#). Duplicate function evaluations are detected with [duplication_detect\(\)](#).

Reimplemented from [Interface](#).

References Response::active_set(), Interface::algebraic_mappings(), Interface::algebraicMappings, Interface::asv_mapping(), ApplicationInterface::asvControlFlag, ParallelLibrary::bcast_e(), ApplicationInterface::beforeSynchAlgPRPQueue, ApplicationInterface::beforeSynchCorePRPQueue, Response::copy(), Interface::coreMappings, Interface::currEvalId, Dakota::data_pairs, ApplicationInterface::defaultASV, ApplicationInterface::derived_map(), ApplicationInterface::duplication_detect(), ApplicationInterface::evalCacheFlag, Interface::evalIdCntr, Interface::fineGrainEvalCounters, Interface::fnGradCounter, Interface::fnHessCounter, Interface::fnLabels, Interface::fnValCounter, Response::function_labels(), Interface::init_algebraic_mappings(), Interface::interfaceId, ApplicationInterface::lenVarsActSetMessage, ApplicationInterface::manage_failure(), Interface::multiProcEvalFlag, Interface::newEvalIdCntr, Interface::newFnGradCounter, Interface::newFnHessCounter, Interface::newFnValCounter, Interface::outputLevel, ApplicationInterface::parallelLib, ActiveSet::request_vector(), Interface::response_mapping(), ApplicationInterface::restartFileFlag, and Dakota::write_restart.

43.4.2.3 const IntResponseMap & synch () [protected, virtual]

executes a blocking schedule for asynchronous evaluations in the [beforeSynchCorePRPQueue](#) and returns all jobs. This function provides blocking synchronization for all cases of asynchronous evaluations, including the local asynchronous case (background system call, nonblocking fork, & multithreads), the message passing case, and the hybrid case. Called from [derived_synchronize\(\)](#) in derived [Model](#) classes.

Reimplemented from [Interface](#).

References Interface::algebraic_mappings(), Interface::algebraicMappings, ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::asynchronous_local_evaluations(), ApplicationInterface::asynchronous_local_evaluations_static(), ApplicationInterface::beforeSynchAlgPRPQueue, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::beforeSynchDuplicateMap, Interface::coreMappings, ApplicationInterface::historyDuplicateMap, Interface::ieDedMasterFlag, ApplicationInterface::ieMessagePass, Interface::outputLevel, Interface::rawResponseMap, Interface::response_mapping(), ApplicationInterface::self_schedule_evaluations(), and ApplicationInterface::static_schedule_evaluations().

43.4.2.4 const IntResponseMap & synch_nowait () [protected, virtual]

executes a nonblocking schedule for asynchronous evaluations in the beforeSynchCorePRPQueue and returns a partial set of completed jobs This function will eventually provide nonblocking synchronization for all cases of asynchronous evaluations, however it currently supports only the local asynchronous case since nonblocking message passing schedulers have not yet been implemented. Called from derived_synchronize_nowait() in derived [Model](#) classes.

Reimplemented from [Interface](#).

References Dakota::abort_handler(), Interface::algebraic_mappings(), Interface::algebraicMappings, ApplicationInterface::asynchronous_local_evaluations_nowait(), ApplicationInterface::beforeSynchAlgPRPQueue, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::beforeSynchDuplicateMap, Interface::coreMappings, ParamResponsePair::eval_id(), ApplicationInterface::headerFlag, ApplicationInterface::historyDuplicateMap, ApplicationInterface::ieMessagePass, Dakota::lookup_by_eval_id(), Interface::outputLevel, ParamResponsePair::prp_response(), Interface::rawResponseMap, Interface::response_mapping(), and Response::update().

43.4.2.5 void serve_evaluations () [protected, virtual]

run on evaluation servers to serve the iterator master Invoked by the serve() function in derived [Model](#) classes. Passes control to [serve_evaluations_asynch\(\)](#), [serve_evaluations_peer\(\)](#), or [serve_evaluations_synch\(\)](#) according to specified concurrency and self/static scheduler configuration.

Reimplemented from [Interface](#).

References ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::evalServerId, Interface::ieDedMasterFlag, ApplicationInterface::serve_evaluations_asynch(), ApplicationInterface::serve_evaluations_peer(), and ApplicationInterface::serve_evaluations_synch().

43.4.2.6 void stop_evaluation_servers () [protected, virtual]

used by the iterator master to terminate evaluation servers This code is executed on the iteratorComm rank 0 processor when iteration on a particular model is complete. It sends a termination signal (tag = 0 instead of a valid fn_eval_id) to each of the slave analysis servers. NOTE: This function is called from the [Strategy](#) layer even when in serial mode. Therefore, use iteratorCommSize to provide appropriate fall through behavior.

Reimplemented from [Interface](#).

References ParallelLibrary::bcast_e(), ParallelLibrary::free(), Interface::ieDedMasterFlag, ParallelLibrary::isend_ie(), ApplicationInterface::iteratorCommSize, Interface::multiProcEvalFlag, ApplicationInterface::numEvalServers, and ApplicationInterface::parallelLib.

43.4.2.7 void self_schedule_analyses () [protected]

blocking self-schedule of all analyses within a function evaluation using message passing This code is called from derived classes to provide the master portion of a master-slave algorithm for the dynamic self-scheduling of analyses among slave servers. It is patterned after [self_schedule_evaluations\(\)](#). It performs no analyses locally and matches either [serve_analyses_synch\(\)](#) or [serve_analyses_asynch\(\)](#) on the slave servers, depending on the value of asynchLocalAnalysisConcurrency. Self-scheduling approach assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalAnalysisConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within [ParallelLibrary](#).

References ApplicationInterface::asynchLocalAnalysisConcurrency, ParallelLibrary::free(),
ParallelLibrary::irecv_ea(), ParallelLibrary::isend_ea(), ApplicationInterface::numAnalysisDrivers, ApplicationInterface::numAnalysisServers, ApplicationInterface::parallelLib, ParallelLibrary::waitall(), and ParallelLibrary::watsome().

Referenced by DirectAplicInterface::derived_map(), ForkAplicInterface::fork_application(), and
SysCallAplicInterface::spawn_application().

43.4.2.8 void serve_analyses_synch () [protected]

serve the master analysis scheduler and manage one synchronous analysis job at a time This code is called from derived classes to run synchronous analyses on slave processors. The slaves receive requests (blocking receive), do local derived_map_ac's, and return codes. This is done continuously until a termination signal is received from the master. It is patterned after [serve_evaluations_synch\(\)](#).

References ApplicationInterface::analysisCommRank, ParallelLibrary::bcast_a(),
ApplicationInterface::derived_synchronous_local_analysis(), ParallelLibrary::isend_ea(), ApplicationInterface::multiProcAnalysisFlag, ApplicationInterface::parallelLib, ParallelLibrary::recv_ea(), and ParallelLibrary::wait().

Referenced by DirectAplicInterface::derived_map(), ForkAplicInterface::fork_application(), and
SysCallAplicInterface::spawn_application().

43.4.2.9 bool duplication_detect (const Variables & vars, Response & response, const bool asynch_flag) [private]

checks data_pairs and beforeSynchCorePRPQueue to see if the current evaluation request has already been performed or queued Called from [map\(\)](#) to check incoming evaluation request for duplication with content of data_pairs and beforeSynchCorePRPQueue. If duplication is detected, return true, else return false. Manage bookkeeping with historyDuplicateMap and beforeSynchDuplicateMap. Note that the list searches can get very expensive if a long list is searched on every new function evaluation (either from a large number of previous jobs, a large number of pending jobs, or both). For this reason, a user request for deactivation of the evaluation cache results in a complete bypass of [duplication_detect\(\)](#), even though a beforeSynchCorePRPQueue search would still be meaningful. Since the intent of this request is to streamline operations, both list searches are bypassed.

References Response::active_set(), ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::beforeSynchDuplicateMap, Response::copy(), Dakota::data_pairs, Interface::evalIdCntr, Dakota::hashedQueueEnd(), ApplicationInterface::historyDuplicateMap, Interface::interfaceId, Dakota::lookup_by_val(), and Response::update().

Referenced by ApplicationInterface::map().

43.4.2.10 void self_schedule_evaluations () [private]

blocking self-schedule of all evaluations in beforeSynchCorePRPQueue using message passing; executes on iteratorComm master This code is called from [synch\(\)](#) to provide the master portion of a master-slave algorithm for the dynamic self-scheduling of evaluations among slave servers. It performs no evaluations locally and matches either [serve_evaluations_synch\(\)](#) or [serve_evaluations_asynch\(\)](#) on the slave servers, depending on the value of asynchLocalEvalConcurrency. Self-scheduling approach assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalEvalConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within [ParallelLibrary](#).

References ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::beforeSynchCorePRPQueue, Dakota::data_pairs, ApplicationInterface::evalCacheFlag, ParallelLibrary::free(), ParallelLibrary::irecv_ie(), ParallelLibrary::isend_ie(), ApplicationInterface::lenResponseMessage, Dakota::lookup_by_eval_id(), ApplicationInterface::numEvalServers, Interface::outputLevel, ApplicationInterface::parallelLib, Interface::rawResponseMap, MPIUnpackBuffer::reset(), MPIPackBuffer::reset(), MPIUnpackBuffer::resize(), ApplicationInterface::restartFileFlag, ParallelLibrary::waitall(), ParallelLibrary::watsome(), and Dakota::write_restart.

Referenced by ApplicationInterface::synch().

43.4.2.11 void static_schedule_evaluations () [private]

blocking static schedule of all evaluations in beforeSynchCorePRPQueue using message passing; executes on iteratorComm master This code runs on the iteratorCommRank 0 processor (the iterator) and is called from [synch\(\)](#) in order to assign a static schedule. It matches [serve_evaluations_peer\(\)](#) for any other processors within the first evaluation partition and [serve_evaluations_{synch,asynch}\(\)](#) for all other evaluation partitions (depending on asynchLocalEvalConcurrency). It performs function evaluations locally for its portion of the static schedule using either [asynchronous_local_evaluations\(\)](#) or [synchronous_local_evaluations\(\)](#). Single-level and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within [ParallelLibrary](#). The iteratorCommRank 0 processor assigns the static schedule since it is the only processor with access to beforeSynchCorePRPQueue (it runs the iterator and calls synchronize). The alternate design of each peer selecting its own jobs using the modulus operator would be applicable if execution of this function (and therefore the job list) were distributed.

References ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::asynchLocalEvalStatic, ApplicationInterface::asynchronous_local_evaluations(), ApplicationInterface::beforeSynchCorePRPQueue, Dakota::data_pairs, ApplicationInterface::evalCacheFlag, ParallelLibrary::free(), ParallelLibrary::irecv_ie(), ParallelLibrary::isend_ie(), ApplicationInterface::lenResponseMessage, ApplicationInterface::numEvalServers, Interface::outputLevel, ApplicationInterface::parallelLib, Interface::rawResponseMap, MPIUnpackBuffer::resize(), ApplicationInterface::restartFileFlag, ApplicationInterface::synchronous_local_evaluations(), ParallelLibrary::waitall(), and Dakota::write_restart.

Referenced by ApplicationInterface::synch().

43.4.2.12 void asynchronous_local_evaluations (PRPQueue & prp_queue) [private]

perform all jobs in prp_queue using asynchronous approaches on the local processor This function provides blocking synchronization for the local asynch case (foreground system call, nonblocking fork, or threads). It can be called from [synch\(\)](#) for a complete local scheduling of all asynchronous jobs or from [static_schedule_evaluations\(\)](#) to perform a local portion of the total job set. It uses the [derived_map_asynch\(\)](#) to initiate asynchronous evaluations and [derived_synch\(\)](#) to capture completed jobs, and mirrors the [self_schedule_evaluations\(\)](#) message passing scheduler as much as possible ([derived_synch\(\)](#) is modeled after MPI_Waitsome()).

References ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::completionSet, Dakota::data_pairs, ApplicationInterface::derived_map_asynch(), ApplicationInterface::derived_synch(), ApplicationInterface::evalCacheFlag, Dakota::lookup_by_eval_id(), Interface::outputLevel, Interface::rawResponseMap, ApplicationInterface::restartFileFlag, and Dakota::write_restart.

Referenced by ApplicationInterface::static_schedule_evaluations(), and ApplicationInterface::synch().

43.4.2.13 void asynchronous_local_evaluations_static (PRPQueue & prp_queue) [private]

perform all the jobs in prp_queue using asynchronous approaches on the local processor, but schedule statically such that eval_id is always replaced with an equivalent one, modulo asynchLocalEvalConcurrency Locally statically-scheduled counterpart to asynchronous_local_evaluations. This scheduling policy specifically ensures that a completed asynchronous evaluation eval_id is replaced with an equivalent one, modulo asynchLocalEvalConcurrency. Designed to help with parallel tiling. A disadvantage of this scheduling policy is that it could leave local asynchronous worker "servers" idle in parsing the prp_queue, e.g., when restarting and some evals are already complete. In fact, anytime this function is called with non-contiguous eval_id's the full possible concurrency won't be leveraged.

This is currently only supported when DAKOTA is running in serial. Supporting in the MPI static / asynch local hybrid mode would require MPI static schedule that is either fully round-robin or fully block scheduled, not the present hybrid. It is not clear how to support this in the MPI self scheduled / asynch local hybrid mode.

If local evaluation concurrency is unlimited, this function is not needed.

Referenced by ApplicationInterface::synch().

43.4.2.14 void synchronous_local_evaluations (PRPQueue & prp_queue) [private]

perform all jobs in prp_queue using synchronous approaches on the local processor This function provides blocking synchronization for the local synchronous case (foreground system call, blocking fork, or procedure call from [derived_map\(\)](#)). It is called from [static_schedule_evaluations\(\)](#) to perform a local portion of the total job set.

References ParallelLibrary::bcast_e(), Interface::currEvalId, Dakota::data_pairs, ApplicationInterface::derived_map(), ApplicationInterface::evalCacheFlag, ApplicationInterface::lenVarsActSetMessage, ApplicationInterface::manage_failure(), Interface::multiProcEvalFlag, Interface::outputLevel, ApplicationInterface::parallelLib, Interface::rawResponseMap, ApplicationInterface::restartFileFlag, and Dakota::write_restart.

Referenced by `ApplicationInterface::static_schedule_evaluations()`.

43.4.2.15 void asynchronous_local_evaluations_nowait (PRPQueue & *prp_queue*) [private]

launch new jobs in `prp_queue` asynchronously (if capacity is available), perform nonblocking query of all running jobs, and process any completed jobs (handles both local self- and local static-scheduling cases) This function provides nonblocking synchronization for the local asynch case (background system call, nonblocking fork, or threads). It is called from `synch_nowait()` and passed the complete set of all asynchronous jobs (`beforeSyncCorePRPQueue`). It uses `derived_map_asynch()` to initiate asynchronous evaluations and `derived_synch_nowait()` to capture completed jobs in nonblocking mode. It mirrors a nonblocking message passing scheduler as much as possible (`derived_synch_nowait()` modeled after `MPI_Testsome()`). The result of this function is `rawResponseMap`, which uses `eval_id` as a key. It is assumed that the incoming `prp_queue` contains only active and new jobs - i.e., all completed jobs are cleared by `synch_nowait()`.

Also supports asynchronous local evaluations with static scheduling. This scheduling policy specifically ensures that a completed asynchronous evaluation `eval_id` is replaced with an equivalent one, modulo `asynchLocalEvalConcurrency`. In the nowait case, this could render some servers idle if evaluations don't come in `eval_id` order or some evaluations are cancelled by the caller in between calls. If this function is called with unlimited local eval concurrency, the static scheduling request is ignored.

References `ApplicationInterface::asynchLocalEvalConcurrency`, `ApplicationInterface::asynchLocalEvalStatic`, `ApplicationInterface::completionSet`, `Dakota::data_pairs`, `ApplicationInterface::derived_map_asynch()`, `ApplicationInterface::derived_synch_nowait()`, `ApplicationInterface::evalCacheFlag`, `ApplicationInterface::localServerJobMap`, `Dakota::lookup_by_eval_id()`, `Interface::outputLevel`, `Interface::rawResponseMap`, `ApplicationInterface::restartFileFlag`, `ApplicationInterface::runningSet`, and `Dakota::write_restart`.

Referenced by `ApplicationInterface::synch_nowait()`.

43.4.2.16 void serve_evaluations_synch () [private]

serve the evaluation message passing schedulers and perform one synchronous evaluation at a time This code is invoked by `serve_evaluations()` to perform one synchronous job at a time on each slave/peer server. The servers receive requests (blocking receive), do local synchronous maps, and return results. This is done continuously until a termination signal is received from the master (sent via `stop_evaluation_servers()`).

References `ParallelLibrary::bcast_e()`, `Interface::currEvalId`, `ApplicationInterface::derived_map()`, `ApplicationInterface::evalCommRank`, `ParallelLibrary::isend_ie()`, `ApplicationInterface::lenResponseMessage`, `ApplicationInterface::lenVarsActSetMessage`, `ApplicationInterface::manage_failure()`, `Interface::multiProcEvalFlag`, `ApplicationInterface::parallelLib`, `ParallelLibrary::recv_ie()`, `MPIPackBuffer::reset()`, `ParallelLibrary::wait()`, and `Variables::write_annotated()`.

Referenced by `ApplicationInterface::serve_evaluations()`.

43.4.2.17 void serve_evaluations_asynch () [private]

serve the evaluation message passing schedulers and manage multiple asynchronous evaluations This code is invoked by `serve_evaluations()` to perform multiple asynchronous jobs on each slave/peer server. The servers test for any incoming jobs, launch any new jobs, process any completed jobs, and return any results. Each of these components is nonblocking, although the server loop continues until a termination signal is received from the master (sent via `stop_evaluation_servers()`). In the master-slave case, the master maintains the correct number of

jobs on each slave. In the static scheduling case, each server is responsible for limiting concurrency (since the entire static schedule is sent to the peers at start up).

References Dakota::abort_handler(), ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::completionSet, ApplicationInterface::derived_map_asynch(), ApplicationInterface::derived_synch_nowait(), Interface::interfaceId, ParallelLibrary::irecv_ie(), ApplicationInterface::lenResponseMessage, ApplicationInterface::lenVarsActSetMessage, Dakota::lookup_by_eval_id(), ApplicationInterface::parallelLib, ParallelLibrary::recv_ie(), MPIUnpackBuffer::reset(), ParallelLibrary::send_ie(), and ParallelLibrary::test().

Referenced by ApplicationInterface::serve_evaluations().

43.4.2.18 void serve_evaluations_peer () [private]

serve the evaluation message passing schedulers and perform one synchronous evaluation at a time as part of the 1st peer This code is invoked by [serve_evaluations\(\)](#) to perform a synchronous evaluation in coordination with the iteratorCommRank 0 processor (the iterator) for static schedules. The bcast() matches either the bcast() in [synchronous_local_evaluations\(\)](#), which is invoked by [static_schedule_evaluations\(\)](#), or the bcast() in [map\(\)](#).

References ParallelLibrary::bcast_e(), Interface::currEvalId, ApplicationInterface::derived_map(), ApplicationInterface::lenVarsActSetMessage, ApplicationInterface::manage_failure(), ApplicationInterface::parallelLib, and Variables::write_annotated().

43.5 Approximation Class Reference

Base class for the approximation class hierarchy. Inheritance diagram for Approximation::

Public Member Functions

- [`Approximation \(\)`](#)
default constructor
- [`Approximation \(ProblemDescDB &problem_db, size_t num_vars\)`](#)
standard constructor for envelope
- [`Approximation \(const String &approx_type, const UShortArray &approx_order, size_t num_vars, short data_order\)`](#)
alternate constructor
- [`Approximation \(const Approximation &approx\)`](#)
copy constructor
- [`virtual ~Approximation \(\)`](#)
destructor
- [`Approximation operator= \(const Approximation &approx\)`](#)
assignment operator
- [`virtual void build \(\)`](#)
builds the approximation from scratch
- [`virtual void rebuild \(\)`](#)
rebuids the approximation incrementally
- [`virtual void pop \(bool save_data\)`](#)
removes entries from end of SurrogateData::{vars,resp}Data (last points appended)
- [`virtual void restore \(\)`](#)
restores state prior to previous append()
- [`virtual bool restore_available \(\)`](#)
queries availability of restoration for trial set
- [`virtual size_t restoration_index \(\)`](#)

return index of trial set within restorable bookkeeping sets

- **virtual void `finalize()`**
finalize approximation by applying all remaining trial sets
- **virtual size_t `finalization_index` (size_t i)**
return index of i-th trailing trial set within restorable bookkeeping sets
- **virtual void `store()`**
store current approximation for later combination
- **virtual void `combine` (short corr_type)**
combine current approximation with previously stored approximation
- **virtual Real `get_value` (const RealVector &x)**
retrieve the approximate function value for a given parameter vector
- **virtual const RealVector & `get_gradient` (const RealVector &x)**
retrieve the approximate function gradient for a given parameter vector
- **virtual const RealSymMatrix & `get_hessian` (const RealVector &x)**
retrieve the approximate function Hessian for a given parameter vector
- **virtual Real `get_prediction_variance` (const RealVector &x)**
retrieve the variance of the predicted value for a given parameter vector
- **virtual Real `get_diagnostic` (const String &metric_type)**
retrieve the diagnostic metric for the diagnostic type specified
- **virtual const RealVector & `approximation_coefficients` () const**
return the coefficient array computed by `build()`/rebuild()
- **virtual void `approximation_coefficients` (const RealVector &approx_coeffs)**
set the coefficient array from external sources, rather than computing with `build()`/rebuild()
- **virtual void `print_coefficients` (std::ostream &s) const**
print the coefficient array computed in `build()`/rebuild()
- **virtual int `min_coefficients` () const**
return the minimum number of samples (unknowns) required to build the derived class approximation type in numVars dimensions
- **virtual int `recommended_coefficients` () const**
return the recommended number of samples (unknowns) required to build the derived class approximation type in numVars dimensions

- **virtual int num_constraints () const**
return the number of constraints to be enforced via an anchor point
- **virtual void clear_current ()**
clear current build data in preparation for next build
- **virtual const bool diagnostics_available ()**
check if diagnostics are available for this approximation type
- **int min_points (bool constraint_flag) const**
*return the minimum number of points required to build the approximation type in numVars dimensions. Uses *-coefficients() and num_constraints().*
- **int recommended_points (bool constraint_flag) const**
return the recommended number of samples to build the approximation type in numVars dimensions (default same as min_points)
- **int num_variables () const**
return the number of variables used in the approximation
- **const Pecos::SurrogateData & approximation_data () const**
return approxData
- **void add (const Pecos::SurrogateDataVars &sdv, bool anchor_flag)**
append to SurrogateData::varsData or assign to SurrogateData::anchorVars
- **void add (const Variables &vars, bool anchor_flag, bool deep_copy)**
extract the relevant RealVector from Variables and invoke add(RealVector&)
- **void add (const Real *sample_c_vars, bool anchor_flag, bool deep_copy)**
create a RealVector view and invoke add(RealVector&)
- **void add (const RealVector &sample_c_vars, bool anchor_flag, bool deep_copy)**
shared code among add(Variables&) and add(Real); adds a new data point by either appending to SurrogateData::varsData or assigning to SurrogateData::anchorVars, as dictated by anchor_flag. Uses add_point() and add_anchor().*
- **void add (const Pecos::SurrogateDataResp &sdr, bool anchor_flag)**
append to SurrogateData::respData or assign to SurrogateData::anchorResp
- **void add (const Response &response, int fn_index, bool anchor_flag, bool deep_copy)**
adds a new data point by either appending to SurrogateData::respData or assigning to SurrogateData::anchorResp, as dictated by anchor_flag. Uses add_point() and add_anchor().
- **void pop_count (size_t count)**
sets popCount (number of entries to pop from end of SurrogateData::{vars,resp}Data, based on size of last data set appended)

- `size_t pop_count () const`
returns popCount (number of entries to pop from end of SurrogateData:::{vars,resp}Data, based on size of last data set appended)
- `void clear_all ()`
clear all build data (current and history) to restore original state
- `void clear_anchor ()`
clear SurrogateData:::anchor{Vars,Resp}
- `void clear_data ()`
clear SurrogateData:::{vars,resp}Data
- `void set_bounds (const RealVector &lower, const RealVector &upper)`
set approximation lower and upper bounds (currently only used by graphics)
- `Approximation * approx_rep () const`
returns approxRep for access to derived class member functions that are not mapped to the top [Approximation](#) level

Protected Member Functions

- `Approximation (BaseConstructor, const ProblemDescDB &problem_db, size_t num_vars)`
constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
- `Approximation (BaseConstructor, const String &approx_type, size_t num_vars, short data_order)`
constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

Protected Attributes

- `short outputLevel`
output verbosity level: {SILENT,QUIET,NORMAL,VERBOSE,DEBUG}_OUTPUT
- `int numVars`
number of variables in the approximation
- `String approxType`
approximation type identifier
- `short buildDataOrder`
order of the data used for surrogate construction, in [ActiveSet](#) request vector 3-bit format.

- RealVector [approxGradient](#)
gradient of the approximation returned by [get_gradient\(\)](#)
- RealSymMatrix [approxHessian](#)
Hessian of the approximation returned by [get_hessian\(\)](#).
- Pecos::SurrogateData [approxData](#)
contains the variables/response data for constructing a single approximation model (one response function)
- RealVector [approxLowerBounds](#)
approximation lower bounds (used by 3D graphics and Surfpack KrigingModel)
- RealVector [approxUpperBounds](#)
approximation upper bounds (used by 3D graphics and Surfpack KrigingModel)

Private Member Functions

- [Approximation * get_approx \(ProblemDescDB &problem_db, size_t num_vars\)](#)
Used only by the standard envelope constructor to initialize approxRep to the appropriate derived type.
- [Approximation * get_approx \(const String &approx_type, const UShortArray &approx_order, size_t num_vars, short data_order\)](#)
Used only by the alternate envelope constructor to initialize approxRep to the appropriate derived type.

Private Attributes

- size_t [popCount](#)
number of points previously added by [append\(\)](#) to be removed by [pop\(\)](#)
- [Approximation * approxRep](#)
pointer to the letter (initialized only for the envelope)
- int [referenceCount](#)
number of objects sharing approxRep

43.5.1 Detailed Description

Base class for the approximation class hierarchy. The [Approximation](#) class is the base class for the response data fit approximation class hierarchy in DAKOTA. One instance of an [Approximation](#) must be created for each function to be approximated (a vector of Approximations is contained in [ApproximationInterface](#)). For memory efficiency and enhanced polymorphism, the approximation hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Approximation](#)) serves as the envelope and one of the derived classes (selected in [Approximation::get_approx\(\)](#)) serves as the letter.

43.5.2 Constructor & Destructor Documentation

43.5.2.1 Approximation ()

default constructor The default constructor is used in `Array<Approximation>` instantiations and by the alternate envelope constructor. `approxRep` is `NULL` in this case (`problem_db` is needed to build a meaningful [Approximation](#) object). This makes it necessary to check for `NULL` in the copy constructor, assignment operator, and destructor.

43.5.2.2 Approximation (ProblemDescDB & *problem_db*, size_t *num_vars*)

standard constructor for envelope Envelope constructor only needs to extract enough data to properly execute `get_approx`, since `Approximation(BaseConstructor, problem_db)` builds the actual base class data for the derived approximations.

References `Dakota::abort_handler()`, `Approximation::approxRep`, and `Approximation::get_approx()`.

43.5.2.3 Approximation (const String & *approx_type*, const UShortArray & *approx_order*, size_t *num_vars*, short *data_order*)

alternate constructor This is the alternate envelope constructor for instantiations on the fly. Since it does not have access to `problem_db`, the letter class is not fully populated. This constructor executes `get_approx(type)`, which invokes the default constructor of the derived letter class, which in turn invokes the default constructor of the base class.

References `Dakota::abort_handler()`, `Approximation::approxRep`, and `Approximation::get_approx()`.

43.5.2.4 Approximation (const Approximation & *approx*)

copy constructor Copy constructor manages sharing of `approxRep` and incrementing of `referenceCount`.

References `Approximation::approxRep`, and `Approximation::referenceCount`.

43.5.2.5 ~Approximation () [virtual]

destructor Destructor decrements `referenceCount` and only deletes `approxRep` when `referenceCount` reaches zero.

References `Approximation::approxRep`, and `Approximation::referenceCount`.

43.5.2.6 Approximation (BaseConstructor, const ProblemDescDB & *problem_db*, size_t *num_vars*) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. `get_approx()` instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling `get_approx()` again). Since the letter IS the representation, its rep pointer is set to `NULL` (an uninitialized pointer causes problems in `~Approximation`).

approxType.endsWith("_interpolation_polynomial") && approxType.endsWith("_orthogonal_polynomial"))

References Approximation::approxType, and ProblemDescDB::get_bool().

43.5.2.7 Approximation (BaseConstructor, const String & *approx_type*, size_t *num_vars*, short *data_order*) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get_approx\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling [get_approx\(\)](#) again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in [~Approximation](#)).

43.5.3 Member Function Documentation

43.5.3.1 Approximation operator= (const Approximation & *approx*)

assignment operator Assignment operator decrements referenceCount for old approxRep, assigns new approxRep, and increments referenceCount for new approxRep.

References Approximation::approxRep, and Approximation::referenceCount.

43.5.3.2 void build () [virtual]

builds the approximation from scratch This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in [GaussProcApproximation](#), [PecosApproximation](#), [SurfpackApproximation](#), [TANA3Approximation](#), and [TaylorApproximation](#).

References Dakota::abort_handler(), Approximation::approxData, Approximation::approxRep, Approximation::build(), Approximation::min_points(), and Approximation::numVars.

Referenced by Approximation::build(), and Approximation::rebuild().

43.5.3.3 void rebuild () [virtual]

rebuids the approximation incrementally This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in [PecosApproximation](#).

References Approximation::approxRep, Approximation::build(), and Approximation::rebuild().

Referenced by Approximation::rebuild().

43.5.3.4 void pop (bool save_data) [virtual]

removes entries from end of SurrogateData::vars,resp}Data (last points appended) This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in [PecosApproximation](#).

References Approximation::approxData, Approximation::approxRep, Approximation::pop(), and Approximation::popCount.

Referenced by Approximation::pop().

43.5.3.5 void restore () [virtual]

restores state prior to previous append() This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in [PecosApproximation](#).

References Approximation::approxData, Approximation::approxRep, Approximation::popCount, Approximation::restoration_index(), and Approximation::restore().

Referenced by Approximation::restore().

43.5.3.6 void finalize () [virtual]

finalize approximation by applying all remaining trial sets This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in [PecosApproximation](#).

References Approximation::approxData, Approximation::approxRep, Approximation::finalization_index(), and Approximation::finalize().

Referenced by Approximation::finalize().

43.5.3.7 void clear_current () [inline, virtual]

clear current build data in preparation for next build Redefined by [TANA3Approximation](#) to clear current data but preserve history.

Reimplemented in [TANA3Approximation](#).

References Approximation::approxRep, Approximation::clear_all(), and Approximation::clear_current().

Referenced by Approximation::clear_current().

43.5.3.8 void clear_all () [inline]

clear all build data (current and history) to restore original state Clears out any history (e.g., [TANA3Approximation](#) use for a different response function in [NonDReliability](#)).

References Approximation::approxData, Approximation::approxRep, and Approximation::clear_all().

Referenced by Approximation::clear_all(), and Approximation::clear_current().

43.5.3.9 Approximation * get_approx (ProblemDescDB & problem_db, size_t num_vars) [private]

Used only by the standard envelope constructor to initialize approxRep to the appropriate derived type. Used only by the envelope constructor to initialize approxRep to the appropriate derived type.

References String::ends(), and ProblemDescDB::get_string().

Referenced by Approximation::Approximation().

43.5.3.10 Approximation * get_approx (const String & approx_type, const UShortArray & approx_order, size_t num_vars, short data_order) [private]

Used only by the alternate envelope constructor to initialize approxRep to the appropriate derived type. Used only by the envelope constructor to initialize approxRep to the appropriate derived type.

References String::ends().

43.5.4 Member Data Documentation

43.5.4.1 short buildDataOrder [protected]

order of the data used for surrogate construction, in [ActiveSet](#) request vector 3-bit format. This setting distinguishes derivative data intended for use in construction (includes derivatives w.r.t. the build variables) from derivative data that may be approximated separately (excludes derivatives w.r.t. auxilliary variables). This setting should also not be inferred directly from the responses specification, since we may need gradient support for evaluating gradients at a single point (e.g., the center of a trust region), but not require gradient evaluations at every point.

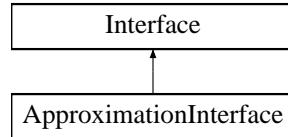

Referenced by SurfpackApproximation::add_sdp_to_surfdata(), TaylorApproximation::build(), TANA3Approximation::build(), GaussProcApproximation::GaussProcApproximation(), TaylorApproximation::get_gradient(), TaylorApproximation::get_hessian(), TaylorApproximation::get_value(), TaylorApproximation::min_coefficients(), Approximation::min_points(), PecosApproximation::PecosApproximation(), Approximation::recommended_points(), SurfpackApproximation::SurfpackApproximation(), SurfpackApproximation::surrogates_to_surf_data(), TANA3Approximation::TANA3Approximation(), and TaylorApproximation::TaylorApproximation().

43.6 ApproximationInterface Class Reference

Derived class within the interface class hierarchy for supporting approximations to simulation-based results. Inheritance diagram for ApproximationInterface::

Public Member Functions

- `ApproximationInterface (ProblemDescDB &problem_db, const Variables &am_vars, bool am_cache, const String &am_interface_id, size_t num_fns)`
primary constructor
- `ApproximationInterface (const String &approx_type, const UShortArray &approx_order, const Variables &am_vars, bool am_cache, const String &am_interface_id, size_t num_fns, short data_order, short output_level)`
alternate constructor for instantiations on the fly
- `~ApproximationInterface ()`
destructor

Protected Member Functions

- `void map (const Variables &vars, const ActiveSet &set, Response &response, const bool asynch_flag=false)`
the function evaluator: provides an approximate "mapping" from the variables to the responses using functionSurfaces
- `int minimum_points (bool constraint_flag) const`
returns the minimum number of samples required to build the functionSurfaces
- `int recommended_points (bool constraint_flag) const`
returns the recommended number of samples recommended to build the functionSurfaces
- `void approximation_function_indices (const IntSet &approx_fn_indices)`
set the (currently active) approximation function index set
- `void update_approximation (const Variables &vars, const IntResponsePair &response_pr)`
- `void update_approximation (const RealMatrix &samples, const IntResponseMap &resp_map)`
- `void update_approximation (const VariablesArray &vars_array, const IntResponseMap &resp_map)`

- void `append_approximation` (const `Variables` &vars, const `IntResponsePair` &response_pr)
- void `append_approximation` (const `RealMatrix` &samples, const `IntResponseMap` &resp_map)
- void `append_approximation` (const `VariablesArray` &vars_array, const `IntResponseMap` &resp_map)
- void `build_approximation` (const `RealVector` &lower_bnds, const `RealVector` &upper_bnds)
- void `rebuild_approximation` (const `BoolDeque` &rebuild_deque)
- void `pop_approximation` (bool save_surr_data)
- void `restore_approximation` ()
- bool `restore_available` ()
- void `finalize_approximation` ()

finalizes the approximation by applying all trial increments
- void `store_approximation` ()

move the current approximation into storage for later combination
- void `combine_approximation` (short corr_type)

combine the current approximation with one previously stored
- void `clear_current` ()

clears current data from an approximation interface
- void `clear_all` ()

clears all data from an approximation interface
- std::vector< `Approximation` > & `approximations` ()

retrieve the Approximations within an `ApproximationInterface`
- const `Pecos::SurrogateData` & `approximation_data` (size_t index)

retrieve the approximation data from a particular `Approximation` within an `ApproximationInterface`
- const `RealVectorArray` & `approximation_coefficients` ()

retrieve the approximation coefficients from each `Approximation` within an `ApproximationInterface`
- void `approximation_coefficients` (const `RealVectorArray` &approx_coeffs)

set the approximation coefficients within each `Approximation` within an `ApproximationInterface`
- const `RealVector` & `approximation_variances` (const `RealVector` &c_vars)

retrieve the approximation variances from each `Approximation` within an `ApproximationInterface`
- const `IntResponseMap` & `synch` ()

recovers data from a series of asynchronous evaluations (blocking)
- const `IntResponseMap` & `synch_nowait` ()

recovers data from a series of asynchronous evaluations (nonblocking)

Private Member Functions

- void `mixed_add` (const `Variables` &vars, const `Response` &response, bool anchor)
add variables/response data to functionSurfaces using a mixture of shallow and deep copies
- void `mixed_add` (const `Real` *c_vars, const `Response` &response, bool anchor)
add variables/response data to functionSurfaces using a mixture of shallow and deep copies
- void `shallow_add` (const `Variables` &vars, const `Response` &response, bool anchor)
add variables/response data to functionSurfaces using a shallow copy
- void `update_pop_counts` (const `IntResponseMap` &resp_map)
update the popCount within each of the functionSurfaces based on the active set definitions within resp_map

Private Attributes

- `IntSet approxFnIndices`
for incomplete approximation sets, this array specifies the response function subset that is approximated
- `std::vector< Approximation > functionSurfaces`
list of approximations, one per response function
- `RealVectorArray functionSurfaceCoeffs`
array of approximation coefficient vectors, one vector per response function
- `RealVector functionSurfaceVariances`
vector of approximation variances, one value per response function
- `StringArray diagnosticSet`
set of diagnostic metrics
- `Variables actualModelVars`
copy of the actualModel variables object used to simplify conversion among differing variable views
- `bool actualModelCache`
indicates usage of an evaluation cache by the actualModel
- `String actualModelInterfaceId`
the interface id from the actualModel used for ordered PRPCache lookups
- `IntResponseMap beforeSynchResponseMap`
bookkeeping map to catalogue responses generated in `map()` for use in `synch()` and `synch_nowait()`. This supports pseudo-asynchronous operations (approximate responses are always computed synchronously, but asynchronous virtual functions are supported through bookkeeping).

43.6.1 Detailed Description

Derived class within the interface class hierarchy for supporting approximations to simulation-based results. [ApproximationInterface](#) provides an interface class for building a set of global/local/multipoint approximations and performing approximate function evaluations using them. It contains a list of [Approximation](#) objects, one for each response function.

43.6.2 Member Function Documentation

43.6.2.1 void update_approximation (const Variables & *vars*, const IntResponsePair & *response_pr*) [protected, virtual]

This function populates/replaces each Approximation::anchorPoint with the incoming variables/response data point.

Reimplemented from [Interface](#).

References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, Dakota::data_pairs, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), and ApproximationInterface::shallow_add().

43.6.2.2 void update_approximation (const RealMatrix & *samples*, const IntResponseMap & *resp_map*) [protected, virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays.

Reimplemented from [Interface](#).

References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, ApproximationInterface::approxFnIndices, Dakota::data_pairs, ApproximationInterface::functionSurfaces, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), and ApproximationInterface::shallow_add().

43.6.2.3 void update_approximation (const VariablesArray & *vars_array*, const IntResponseMap & *resp_map*) [protected, virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays.

Reimplemented from [Interface](#).

References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, ApproximationInterface::approxFnIndices, Dakota::data_pairs, ApproximationInterface::functionSurfaces, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), and ApproximationInterface::shallow_add().

43.6.2.4 void append_approximation (const Variables & *vars*, const IntResponsePair & *response_pr*) [protected, virtual]

This function appends to each Approximation::currentPoints with one incoming variables/response data point.

Reimplemented from [Interface](#).

References `ApproximationInterface::actualModelCache`, `ApproximationInterface::actualModelInterfaceId`, `ApproximationInterface::approxFnIndices`, `Dakota::data_pairs`, `ApproximationInterface::functionSurfaces`, `Dakota::lookup_by_ids()`, `ApproximationInterface::mixed_add()`, and `ApproximationInterface::shallow_add()`.

43.6.2.5 void append_approximation (const RealMatrix & *samples*, const IntResponseMap & *resp_map*) [protected, virtual]

This function appends to each `Approximation::currentPoints` with multiple incoming variables/response data points.

Reimplemented from [Interface](#).

References `Dakota::abort_handler()`, `ApproximationInterface::actualModelCache`, `ApproximationInterface::actualModelInterfaceId`, `Dakota::data_pairs`, `Dakota::lookup_by_ids()`, `ApproximationInterface::mixed_add()`, `ApproximationInterface::shallow_add()`, and `ApproximationInterface::update_pop_counts()`.

43.6.2.6 void append_approximation (const VariablesArray & *vars_array*, const IntResponseMap & *resp_map*) [protected, virtual]

This function appends to each `Approximation::currentPoints` with multiple incoming variables/response data points.

Reimplemented from [Interface](#).

References `Dakota::abort_handler()`, `ApproximationInterface::actualModelCache`, `ApproximationInterface::actualModelInterfaceId`, `Dakota::data_pairs`, `Dakota::lookup_by_ids()`, `ApproximationInterface::mixed_add()`, `ApproximationInterface::shallow_add()`, and `ApproximationInterface::update_pop_counts()`.

43.6.2.7 void build_approximation (const RealVector & *lower_bnds*, const RealVector & *upper_bnds*) [protected, virtual]

This function finds the coefficients for each [Approximation](#) based on the data passed through `update_approximation()` calls. The bounds are used only for graphics visualization.

Reimplemented from [Interface](#).

References `ApproximationInterface::approxFnIndices`, `ApproximationInterface::diagnosticSet`, `ApproximationInterface::functionSurfaces`, and `Interface::outputLevel`.

43.6.2.8 void rebuild_approximation (const BoolDeque & *rebuild_deque*) [protected, virtual]

This function updates the coefficients for each [Approximation](#) based on data increments provided by `{update,append}_approximation()`.

Reimplemented from [Interface](#).

References `ApproximationInterface::approxFnIndices`, and `ApproximationInterface::functionSurfaces`.

43.6.2.9 void pop_approximation (bool save_surr_data) [protected, virtual]

This function removes data provided by a previous call to [append_approximation\(\)](#).

Reimplemented from [Interface](#).

References ApproximationInterface::approxFnIndices, and ApproximationInterface::functionSurfaces.

43.6.2.10 void restore_approximation () [protected, virtual]

This function updates the coefficients for each [Approximation](#) based on data increments provided by {update,append}_approximation().

Reimplemented from [Interface](#).

References ApproximationInterface::approxFnIndices, and ApproximationInterface::functionSurfaces.

43.6.2.11 bool restore_available () [protected, virtual]

This function updates the coefficients for each [Approximation](#) based on data increments provided by {update,append}_approximation().

Reimplemented from [Interface](#).

References ApproximationInterface::approxFnIndices, and ApproximationInterface::functionSurfaces.

43.6.3 Member Data Documentation

43.6.3.1 std::vector<Approximation> functionSurfaces [private]

list of approximations, one per response function This formulation allows the use of mixed approximations (i.e., different approximations used for different response functions), although the input specification is not currently general enough to support it.

Referenced by ApproximationInterface::append_approximation(), ApproximationInterface::approximation_coefficients(), ApproximationInterface::approximation_data(), ApproximationInterface::approximation_variances(), ApproximationInterface::ApproximationInterface(), ApproximationInterface::approximations(), ApproximationInterface::build_approximation(), ApproximationInterface::clear_all(), ApproximationInterface::clear_current(), ApproximationInterface::combine_approximation(), ApproximationInterface::finalize_approximation(), ApproximationInterface::map(), ApproximationInterface::minimum_points(), ApproximationInterface::mixed_add(), ApproximationInterface::pop_approximation(), ApproximationInterface::rebuild_approximation(), ApproximationInterface::recommended_points(), ApproximationInterface::restore_approximation(), ApproximationInterface::restore_available(), ApproximationInterface::shallow_add(), ApproximationInterface::store_approximation(), ApproximationInterface::update_approximation(), and ApproximationInterface::update_pop_counts().

43.7 APPSEvalMgr Class Reference

Evaluation manager class for APPSPACK.

Public Member Functions

- **APPSEvalMgr (Model &model)**
constructor
- **~APPSEvalMgr ()**
destructor
- **bool isReadyForWork () const**
tells APPS whether or not there is a processor available to perform a function evaluation
- **bool submit (const int apps_tag, const HOPSPACK::Vector &apps_xtrial, HOPSPACK::EvalRequestType apps_request)**
*performs a function evaluation at APPS-provided *x_in**
- **int recv (int &apps_tag, HOPSPACK::Vector &apps_f, HOPSPACK::Vector &apps_cEqs, HOPSPACK::Vector &apps_cIneqs, string &apps_msg)**
returns a function value to APPS
- **void printDebugInfo (void) const**
empty implementation of debug info needed to complete the interface
- **void printTimingInfo (void) const**
empty implementation of timing info needed to complete the interface
- **void set_asynch_flag (const bool dakotaAsynchFlag)**
publishes whether or not to do asynchronous evaluations
- **void set_blocking_synch (const bool blockingSynchFlag)**
publishes whether or not APPS is operating synchronously
- **void set_total_workers (const int numDakotaWorkers)**
publishes the number of processors available for function evaluations
- **void set_constraint_map (std::vector< int > constraintMapIndices, std::vector< double > constraintMapMultipliers, std::vector< double > constraintMapOffsets)**
publishes constraint transformation

Private Attributes

- **Model & iteratedModel**
reference to the APPSOptimizer's model passed in the constructor
- **bool modelAsynchFlag**
flag for asynchronous function evaluations
- **bool blockingSynch**
flag for APPS synchronous behavior
- **int numWorkersUsed**
number of processors actively performing function evaluations
- **int numWorkersTotal**
total number of processors available for performing function evaluations
- **std::vector< int > constrMapIndices**
map from Dakota constraint number to APPS constraint number
- **std::vector< double > constrMapMultipliers**
multipliers for constraint transformations
- **std::vector< double > constrMapOffsets**
offsets for constraint transformations
- **RealVector xTrial**
trial iterate
- **std::map< int, int > tagList**
map of DAKOTA eval id to APPS eval id (for asynchronous evaluations)
- **std::map< int, RealVector > functionList**
map of APPS eval id to responses (for synchronous evaluations)
- **IntResponseMap dakotaResponseMap**
map of DAKOTA responses returned by synchronize_nowait()

43.7.1 Detailed Description

Evaluation manager class for APPSPACK. The [APPSEvalMgr](#) class is derived from APPSPACK's Executor class. It implements the methods of that class in such away that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between [Dakota](#) and APPSPACK via this interface.

43.7.2 Constructor & Destructor Documentation

43.7.2.1 APPSEvalMgr (Model & *model*)

constructor Evaluation manager class for APPSPACK.

The [APPSEvalMgr](#) class is derived from APPSPACK's Executor class. It implements the methods of that class in such away that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between [Dakota](#) and APPSPACK via this interface.

43.7.3 Member Function Documentation

43.7.3.1 bool isReadyForWork () const

tells APPS whether or not there is a processor available to perform a function evaluation. Check to see if all processors available for function evaluations are being used. If not, tell APPS that one is available.

References APPSEvalMgr::numWorkersTotal, and APPSEvalMgr::numWorkersUsed.

43.7.3.2 bool submit (const int *apps_tag*, const HOPSPACK::Vector & *apps_xtrial*, HOPSPACK::EvalRequestType *apps_request*)

performs a function evaluation at APPS-provided *x_in*. Convert APPSPACK vector of variables to DAKOTA vector of variables and perform function evaluation asynchronously or not as specified in the DAKOTA input deck. If evaluation is asynchronous, map the dakota id to the APPS tag. If evaluation is synchronous, map the responses to the APPS tag.

References Model::asynch_compute_response(), Model::compute_response(), Model::continuous_variables(), Model::current_response(), Model::evaluation_id(), Response::function_values(), APPSEvalMgr::functionList, APPSEvalMgr::iteratedModel, APPSEvalMgr::modelAsynchFlag, APPSEvalMgr::numWorkersTotal, APPSEvalMgr::numWorkersUsed, APPSEvalMgr::tagList, and APPSEvalMgr::xTrial.

43.7.3.3 int recv (int & *apps_tag*, HOPSPACK::Vector & *apps_f*, HOPSPACK::Vector & *apps_cEqs*, HOPSPACK::Vector & *apps_cIneqs*, string & *apps_msg*)

returns a function value to APPS. Retrieve a set of reponse values, convert to APPS data structures, and return them to APPS. APPS tags are tied to corresponding responses using the appropriate (i.e., asynchronous or synchronous) map.

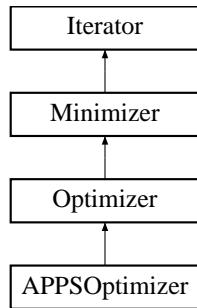

References APPSEvalMgr::blockingSynch, APPSEvalMgr::constrMapIndices, APPSEvalMgr::constrMapMultipliers, APPSEvalMgr::constrMapOffsets, APPSEvalMgr::dakotaResponseMap, APPSEvalMgr::functionList, APPSEvalMgr::iteratedModel, APPSEvalMgr::modelAsynchFlag, Model::num_nonlinear_eq_constraints(), APPSEvalMgr::numWorkersUsed, Model::synchronize(), Model::synchronize_nowait(), and APPSEvalMgr::tagList.

The documentation for this class was generated from the following files:

- APPSEvalMgr.H
- APPSEvalMgr.C

43.8 APPSOptimizer Class Reference

Wrapper class for APPSPACK. Inheritance diagram for APPSOptimizer::

Public Member Functions

- [APPSOptimizer \(Model &model\)](#)
constructor
- [APPSOptimizer \(NoDBBaseConstructor, Model &model\)](#)
alternate constructor for on-the-fly instantiations
- [~APPSOptimizer \(\)](#)
destructor
- [void find_optimum \(\)](#)
Performs the iterations to determine the optimal solution.

Protected Member Functions

- [void set_apps_parameters \(\)](#)
sets options for specific methods based on user specifications
- [void initialize_variables_and_constraints \(\)](#)
initializes problem variables and constraints

Protected Attributes

- [HOPSPACK::ParameterList params](#)
Pointer to APPS parameter list.
- [HOPSPACK::ParameterList * problemParams](#)

Pointer to APPS problem parameter sublist.

- HOPSPACK::ParameterList * [linearParams](#)

Pointer to APPS linear constraint parameter sublist.

- HOPSPACK::ParameterList * [mediatorParams](#)

Pointer to APPS mediator parameter sublist.

- HOPSPACK::ParameterList * [citizenParams](#)

Pointer to APPS citizen/algorith parameter sublist.

- APPSEvalMgr * [evalMgr](#)

Pointer to the APPS evaluation manager object.

- std::vector< int > [constraintMapIndices](#)

map from Dakota constraint number to APPS constraint number

- std::vector< double > [constraintMapMultipliers](#)

multipliers for constraint transformations

- std::vector< double > [constraintMapOffsets](#)

offsets for constraint transformations

43.8.1 Detailed Description

Wrapper class for APPSPACK. The [APPSOptimizer](#) class provides a wrapper for APPSPACK, a Sandia-developed C++ library for generalized pattern search. APPSPACK defaults to a coordinate pattern search but also allows for augmented search patterns. It can solve problems with bounds, linear constraints, and general nonlinear constraints. [APPSOptimizer](#) uses an [APPSEvalMgr](#) object to manage the function evaluations.

The user input mappings are as follows: `output max_function_evaluations, constraint_tol initial_delta, contraction_factor, threshold_delta, solution_target, synchronization, merit_function, constraint_penalty, and smoothing_factor` are mapped into APPS's "Debug", "Maximum Evaluations", "Bounds Tolerance"/"Machine Epsilon"/"Constraint Tolerance", "Initial Step", "Contraction Factor", "Step Tolerance", "Function Tolerance", "Synchronous", "Method", "Initial Penalty Value", and "Initial Smoothing Value" data attributes. Refer to the APPS web site (<http://software.sandia.gov/appspack>) for additional information on APPS objects and controls.

43.8.2 Constructor & Destructor Documentation

43.8.2.1 APPSOptimizer (Model & *model*)

constructor Wrapper class for HOPSPACK.

The [APPSOptimizer](#) class provides a wrapper for HOPSPACK, a Sandia-developed C++ library for generalized pattern search. HOPSPACK defaults to a coordinate pattern search but also allows for augmented search patterns.

It can solve problems with bounds, linear constraints, and general nonlinear constraints. [APPSOptimizer](#) uses an [APPSEvalMgr](#) object to manage the function evaluations.

The user input mappings are as follows: `output max_function_evaluations, constraint_tol initial_delta, contraction_factor, threshold_delta, solution_target, synchronization, merit_function, constraint_penalty, and smoothing_factor` are mapped into HOPS's "Display", "Maximum Evaluations", "Active Tolerance"/"Nonlinear Active Tolerance", "Initial Step", "Contraction Factor", "Step Tolerance", "Objective Target", "Synchronous Evaluations", "Penalty Function", "Penalty Parameter", and "Penalty Smoothing Value" data attributes. Refer to the HOPS web site (<https://software.sandia.gov/trac/hopspack>) for additional information on HOPS objects and controls.

References `APPSOptimizer::evalMgr, Model::init_communicators(), Iterator::iteratedModel, Optimizer::localObjectiveRecast, Iterator::maxConcurrency, Minimizer::scaleFlag, and APPSOptimizer::set_apps_parameters()`.

43.8.3 Member Function Documentation

43.8.3.1 void find_optimum () [virtual]

Performs the iterations to determine the optimal solution. `find_optimum` redefines the [Optimizer](#) virtual function to perform the optimization using HOPS. It first sets up the problem data, then executes `minimize()` on the HOPS optimizer, and finally catalogues the results.

Implements [Optimizer](#).

References `Model::asynch_flag(), APPSOptimizer::constraintMapIndices, APPSOptimizer::constraintMapOffsets, APPSOptimizer::initialize_variables_and_constraints(), APPSOptimizer::localObjectiveRecast, APPSEvalMgr::set_asynch_flag(), and APPSEvalMgr::set_total_workers()`, `Iterator::bestResponseArray, APPSOptimizer::constraintMapMultipliers, APPSOptimizer::evalMgr, Model::evaluation_capacity(), Iterator::iteratedModel, Optimizer::numContinuousVars, Iterator::numFunctions, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, APPSOptimizer::params, APPSEvalMgr::set_total_workers()`.

43.8.3.2 void set_apps_parameters () [protected]

sets options for specific methods based on user specifications Set all of the HOPS algorithmic parameters as specified in the DAKOTA input deck. This is called at construction time.

References `APPSOptimizer::citizenParams, Minimizer::constraintTol, APPSOptimizer::evalMgr, ProblemDescDB::get_real(), ProblemDescDB::get_string(), ProblemDescDB::is_null(), APPSOptimizer::linearParams, Iterator::maxConcurrency, Iterator::maxFunctionEvals, APPSOptimizer::mediatorParams, Iterator::numContinuousVars, Minimizer::numNonlinearConstraints, Iterator::outputLevel, APPSOptimizer::params, Iterator::probDescDB, APPSOptimizer::problemParams, and APPSEvalMgr::set_blocking_synch()`.

Referenced by `APPSOptimizer::APPSOptimizer()`.

43.8.3.3 void initialize_variables_and_constraints () [protected]

initializes problem variables and constraints Set the variables and constraints as specified in the DAKOTA input deck. This is done at run time.

References Minimizer::bigRealBoundSize, APPSOptimizer::constraintMapIndices, APPSOptimizer::constraintMapMultipliers, APPSOptimizer::constraintMapOffsets, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::continuous_variables(), APPSOptimizer::evalMgr, Iterator::iteratedModel, Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::linear_ineq_constraint_lower_bounds(), Model::linear_ineq_constraint_upper_bounds(), APPSOptimizer::linearParams, Model::nonlinear_eq_constraint_targets(), Model::nonlinear_ineq_constraint_lower_bounds(), Model::nonlinear_ineq_constraint_upper_bounds(), Iterator::numContinuousVars, Minimizer::numLinearEqConstraints, Minimizer::numLinearIneqConstraints, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, APPSOptimizer::problemParams, and APPSEvalMgr::set_constraint_map().

Referenced by APPSOptimizer::find_optimum().

The documentation for this class was generated from the following files:

- APPSOptimizer.H
- APPSOptimizer.C

43.9 BaseConstructor Struct Reference

Dummy struct for overloading letter-envelope constructors.

Public Member Functions

- [BaseConstructor \(int=0\)](#)
C++ structs can have constructors.

43.9.1 Detailed Description

Dummy struct for overloading letter-envelope constructors. [BaseConstructor](#) is used to overload the constructor for the base class portion of letter objects. It avoids infinite recursion (Coplien p.139) in the letter-envelope idiom by preventing the letter from instantiating another envelope. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- `global_defs.h`

43.10 BiStream Class Reference

The binary input stream class. Overloads the `>>` operator for all data types.

Public Member Functions

- **BiStream ()**
Default constructor, need to open.
- **BiStream (const char *s)**
Constructor takes name of input file.
- **BiStream (const char *s, std::ios_base::openmode mode)**
Constructor takes name of input file, mode.
- **~BiStream ()**
Destructor, calls `xdr_destroy` to delete `xdr` stream.
- **BiStream & operator>> (std::string &ds)**
Binary Input stream operator>>.
- **BiStream & operator>> (char *s)**
Input operator, reads `char` from binary stream `BiStream`.*
- **BiStream & operator>> (char &c)**
Input operator, reads `char` from binary stream `BiStream`.
- **BiStream & operator>> (int &i)**
Input operator, reads `int` from binary stream `BiStream`.*
- **BiStream & operator>> (long &l)**
Input operator, reads `long` from binary stream `BiStream`.
- **BiStream & operator>> (short &s)**
Input operator, reads `short` from binary stream `BiStream`.
- **BiStream & operator>> (bool &b)**
Input operator, reads `bool` from binary stream `BiStream`.
- **BiStream & operator>> (double &d)**
Input operator, reads `double` from binary stream `BiStream`.
- **BiStream & operator>> (float &f)**
Input operator, reads `float` from binary stream `BiStream`.

- **BiStream & operator>> (unsigned char &c)**

Input operator, reads unsigned char from binary stream BiStream.*

- **BiStream & operator>> (unsigned int &i)**

Input operator, reads unsigned int from binary stream BiStream.

- **BiStream & operator>> (unsigned long &l)**

Input operator, reads unsigned long from binary stream BiStream.

- **BiStream & operator>> (unsigned short &s)**

Input operator, reads unsigned short from binary stream BiStream.

Private Attributes

- XDR **xdrInBuf**

XDR input stream buffer.

- char **inBuf** [MAX_NETOBJ_SZ]

Buffer to hold data as it is read in.

43.10.1 Detailed Description

The binary input stream class. Overloads the >> operator for all data types. The **Dakota::BiStream** class is a binary input class which overloads the >> operator for all standard data types (int, char, float, etc). The class relies on the methods within the ifstream base class. The **Dakota::BiStream** class inherits from the ifstream class. If available, the class utilize rpc/xdr to construct machine independent binary files. These **Dakota** restart files can be moved from host to host. The motivation to develop these classes was to replace the Rogue wave classes which **Dakota** historically used for binary I/O.

43.10.2 Constructor & Destructor Documentation

43.10.2.1 BiStream ()

Default constructor, need to open. Default constructor, allocates xdr stream , but does not call the open method. The open method must be called before stream can be read.

References BiStream::inBuf, and BiStream::xdrInBuf.

43.10.2.2 BiStream (const char * s)

Constructor takes name of input file. Constructor which takes a char* filename. Calls the base class open method with the filename and no other arguments. Also allocates the xdr stream.

References BiStream::inBuf, and BiStream::xdrInBuf.

43.10.2.3 BiStream (const char * *s*, std::ios_base::openmode *mode*)

Constructor takes name of input file, mode. Constructor which takes a char* filename and int flags. Calls the base class open method with the filename and flags as arguments. Also allocates xdr stream.

References BiStream::inBuf, and BiStream::xdrInBuf.

43.10.2.4 ~BiStream ()

Destructor, calls xdr_destroy to delete xdr stream. Destructor, destroys the xdr stream allocated in constructor

References BiStream::xdrInBuf.

43.10.3 Member Function Documentation**43.10.3.1 BiStream & operator>> (std::string & *ds*)**

Binary Input stream operator>>. The std::string input operator must first read both the xdr buffer size and the size of the string written. Once these are read it can then read and convert the std::string correctly.

References BiStream::inBuf, and BiStream::xdrInBuf.

43.10.3.2 BiStream & operator>> (char * *s*)

Input operator, reads char* from binary stream [BiStream](#). Reading char array is a special case. The method has no way of knowing if the length to the input array is large enough, it assumes it is one char longer than actual string, (Null terminator added). As with the std::string the size of the xdr buffer as well as the char array size written must be read from the stream prior to reading and converting the char array.

References BiStream::inBuf, and BiStream::xdrInBuf.

The documentation for this class was generated from the following files:

- DakotaBinStream.H
- DakotaBinStream.C

43.11 BoStream Class Reference

The binary output stream class. Overloads the << operator for all data types.

Public Member Functions

- **BoStream ()**
Default constructor, need to open.
- **BoStream (const char *s)**
Constructor takes name of input file.
- **BoStream (const char *s, std::ios_base::openmode mode)**
Constructor takes name of input file, mode.
- **~BoStream () throw ()**
Destructor, calls `xdr_destroy` to delete `xdr` stream.
- **BoStream & operator<< (const std::string &ds)**
Binary Output stream operator<<.
- **BoStream & operator<< (const char *s)**
Output operator, writes char TO binary stream `BoStream`.*
- **BoStream & operator<< (const char &c)**
Output operator, writes char to binary stream `BoStream`.
- **BoStream & operator<< (const int &i)**
Output operator, writes int to binary stream `BoStream`.
- **BoStream & operator<< (const long &l)**
Output operator, writes long to binary stream `BoStream`.
- **BoStream & operator<< (const short &s)**
Output operator, writes short to binary stream `BoStream`.
- **BoStream & operator<< (const bool &b)**
Output operator, writes bool to binary stream `BoStream`.
- **BoStream & operator<< (const double &d)**
Output operator, writes double to binary stream `BoStream`.
- **BoStream & operator<< (const float &f)**
Output operator, writes float to binary stream `BoStream`.

- **BoStream & operator<< (const unsigned char &c)**
Output operator, writes unsigned char to binary stream BoStream.
- **BoStream & operator<< (const unsigned int &i)**
Output operator, writes unsigned int to binary stream BoStream.
- **BoStream & operator<< (const unsigned long &l)**
Output operator, writes unsigned long to binary stream BoStream.
- **BoStream & operator<< (const unsigned short &s)**
Output operator, writes unsigned short to binary stream BoStream.

Private Attributes

- XDR **xdrOutBuf**
XDR output stream buffer.
- char **outBuf [MAX_NETOBJ_SZ]**
Buffer to hold converted data before it is written.

43.11.1 Detailed Description

The binary output stream class. Overloads the << operator for all data types. The Dakota::BoStream class is a binary output classes which overloads the << operator for all standard data types (int, char, float, etc). The class relies on the built in write methods within the ostream base classes. Dakota::BoStream inherits from the ofstream class. The motivation to develop this class was to replace the Rogue wave class which Dakota historically used for binary I/O. If available, the class utilize rpc/xdr to construct machine independent binary files. These Dakota restart files can be moved between hosts.

43.11.2 Constructor & Destructor Documentation

43.11.2.1 BoStream ()

Default constructor, need to open. Default constructor allocates the xdr stream but does not call the open() method. The open() method must be called before stream can be written to.

References BoStream::outBuf, and BoStream::xdrOutBuf.

43.11.2.2 BoStream (const char * s)

Constructor takes name of input file. Constructor, takes char * filename as argument. Calls base class open method with filename and no other arguments. Also allocates xdr stream

References BoStream::outBuf, and BoStream::xdrOutBuf.

43.11.2.3 BoStream (`const char * s, std::ios_base::openmode mode`)

Constructor takes name of input file, mode. Constructor, takes `char *` filename and `int` flags as arguments. Calls base class open method with filename and flags as arguments. Also allocates xdr stream. Note : If no rpc/xdr support xdr calls are #ifdef'd out.

References `BoStream::outBuf`, and `BoStream::xdrOutBuf`.

43.11.3 Member Function Documentation

43.11.3.1 BoStream & operator<< (`const std::string & ds`)

Binary Output stream operator`<<`. The `std::string` operator`<<` must first write the xdr buffer size and the original string size to the stream. The input operator needs this information to be able to correctly read and convert the `std::string`.

References `BoStream::outBuf`, and `BoStream::xdrOutBuf`.

43.11.3.2 BoStream & operator<< (`const char * s`)

Output operator, writes `char*` TO binary stream [BoStream](#). The output of `char*` is the same as the output of the `std::string`. The size of the xdr buffer and the size of the string must be written first, then the string itself.

References `BoStream::outBuf`, and `BoStream::xdrOutBuf`.

The documentation for this class was generated from the following files:

- DakotaBinStream.H
- DakotaBinStream.C

43.12 COLINApplication Class Reference

Public Member Functions

- `COLINApplication ()`
Default constructor. Required by COLIN's ApplicationHandle creation.
- `COLINApplication (Model &model)`
Constructor with Model (not presently used).
- `~COLINApplication ()`
Destructor.
- `void set_problem (Model &model)`
Helper function called after default construction to extract problem information from the Model and set it for COLIN.
- `void set_blocking_synch (const bool blockingSynchFlag)`
publishes whether or not COLIN is operating synchronously
- `virtual utilib::Any spawn_evaluation_impl (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)`
Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID.
- `virtual bool evaluation_available ()`
Check to see if there are any function values ready to be collected.
- `virtual void perform_evaluation_impl (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed, colin::AppResponse::response_map_t &colin_responses)`
Perform a function evaluation at t given point.
- `virtual utilib::Any collect_evaluation_impl (colin::AppResponse::response_map_t &responses, utilib::seed_t &seed)`
Collect a completed evaluation from DAKOTA.
- `virtual void colin_request_to_dakota_request (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)`
Helper function to convert evaluation request data from COLIN structures to DAKOTA structures.
- `virtual void dakota_response_to_colin_response (const Response &dakota_response, colin::AppResponse::response_map_t &colin_responses)`
Helper function to convert evaluation response data from DAKOTA structures to COLIN structures.
- `virtual bool map_domain (const utilib::Any &src, utilib::Any &native, bool forward=true) const`
Map the domain point into data type desired by this application context.

Protected Attributes

- Model `iteratedModel`

Shallow copy of the model on which COLIN will iterate.

- bool `blockingSynch`

Flag for COLIN synchronous behavior (Pattern Search only).

- ActiveSet `activeSet`

Local copy of model's active set for convenience.

- std::vector< int > `requestedEvals`

Evaluations queued for asynch evaluation.

- IntResponseMap `dakota_responses`

eval_id to response mapping to cache completed jobs.

43.12.1 Detailed Description

`COLINApplication` is a DAKOTA class that is derived from COLIN's Application hierarchy. It redefines a variety of virtual COLIN functions to use the corresponding DAKOTA functions. This is a more flexible algorithm library interfacing approach than can be obtained with the function pointer approaches used by `NPSOLOptimizer` and `SNLLOptimizer`.

43.12.2 Member Function Documentation

43.12.2.1 void `set_problem` (Model & *model*)

Helper function called after default construction to extract problem information from the `Model` and set it for COLIN. Set variable bounds and linear and nonlinear constraints. This avoids using `probDescDB`, so it is called by both the standard and the on-the-fly `COLINOptimizer` constructors.

References Response::active_set(), COLINApplication::activeSet, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::current_response(), Model::cv(), Model::discrete_design_set_int_values(), Model::discrete_design_set_real_values(), Model::discrete_int_lower_bounds(), Model::discrete_int_upper_bounds(), Model::drv(), Model::drv(), COLINApplication::iteratedModel, Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::linear_ineq_constraint_lower_bounds(), Model::linear_ineq_constraint_upper_bounds(), Model::nonlinear_eq_constraint_targets(), Model::nonlinear_ineq_constraint_lower_bounds(), Model::nonlinear_ineq_constraint_upper_bounds(), Model::num_functions(), Model::num_linear_eq_constraints(), Model::num_linear_ineq_constraints(), Model::num_nonlinear_eq_constraints(), and Model::num_nonlinear_ineq_constraints().

Referenced by COLINApplication::COLINApplication().

43.12.2.2 utilib::Any spawn_evaluation_impl (const utilib::Any & *domain*, const colin::AppRequest::request_map_t & *requests*, utilib::seed_t & *seed*) [virtual]

Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID. Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID. This is only called by COLIN's concurrent evaluator, which is only instantiated when the [Model](#) supports asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)

References [COLINApplication::activeSet](#), [Model::asynch_compute_response\(\)](#), [COLINApplication::colin_request_to_dakota_request\(\)](#), [Model::evaluation_id\(\)](#), and [COLINApplication::iteratedModel](#).

43.12.2.3 bool evaluation_available () [virtual]

Check to see if there are any function values ready to be collected. Check to see if any asynchronous evaluations have finished. This is only called by COLIN's concurrent evaluator, which is only instantiated when the [Model](#) supports asynch evals.

References [COLINApplication::dakota_responses](#), [COLINApplication::iteratedModel](#), and [Model::synchronize\(\)](#).

43.12.2.4 void perform_evaluation_impl (const utilib::Any & *domain*, const colin::AppRequest::request_map_t & *requests*, utilib::seed_t & *seed*, colin::AppResponse::response_map_t & *colin_responses*) [virtual]

Perform a function evaluation at t given point. Perform an evaluation at a specified domain point. Wait for and return the response. This is only called by COLIN's serial evaluator, which is only instantiated when the [Model](#) does not support asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)

References [COLINApplication::activeSet](#), [COLINApplication::colin_request_to_dakota_request\(\)](#), [Model::compute_response\(\)](#), [Model::current_response\(\)](#), [COLINApplication::dakota_response_to_colin_response\(\)](#), and [COLINApplication::iteratedModel](#).

43.12.2.5 utilib::Any collect_evaluation_impl (colin::AppResponse::response_map_t & *colin_responses*, utilib::seed_t & *seed*) [virtual]

Collect a completed evaluation from DAKOTA. Collect the next completed evaluation from DAKOTA. Always returns the evalid of the response returned.

References [COLINApplication::dakota_response_to_colin_response\(\)](#), and [COLINApplication::dakota_responses](#).

43.12.2.6 void colin_request_to_dakota_request (const utilib::Any & *domain*, const colin::AppRequest::request_map_t & *requests*, utilib::seed_t & *seed*) [virtual]

Helper function to convert evaluation request data from COLIN structures to DAKOTA structures. Map COLIN info requests to DAKOTA objectives and constraints.

References Model::continuous_variables(), Model::discrete_design_set_int_values(), Model::discrete_design_set_real_values(), Model::discrete_int_variables(), Model::discrete_real_variables(), Model::div(), Model::drv(), COLINApplication::iteratedModel, Model::num_functions(), and Dakota::set_index_to_value().

Referenced by COLINApplication::perform_evaluation_impl(), and COLINApplication::spawn_evaluation_-impl().

43.12.2.7 void dakota_response_to_colin_response (const Response & *dakota_response*, colin::AppResponse::response_map_t & *colin_responses*) [virtual]

Helper function to convert evaluation response data from DAKOTA structures to COLIN structures. Map DAKOTA objective and constraint values to COLIN response.

References Response::active_set_request_vector(), and Response::function_value().

Referenced by COLINApplication::collect_evaluation_impl(), and COLINApplication::perform_evaluation_-impl().

43.12.2.8 bool map_domain (const utilib::Any & *src*, utilib::Any & *native*, bool *forward* = true) const [virtual]

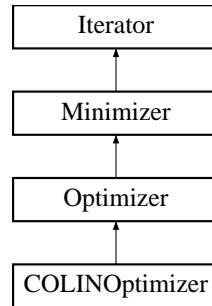

Map the domain point into data type desired by this application context. Map the domain point into data type desired by this application context (utilib::MixedIntVars). This data type can be exposed from the Any &domain presented to spawn and collect.

The documentation for this class was generated from the following files:

- COLINApplication.H
- COLINApplication.C

43.13 COLINOptimizer Class Reference

Wrapper class for optimizers defined using COLIN. Inheritance diagram for COLINOptimizer::

Public Member Functions

- [COLINOptimizer \(Model &model\)](#)
constructor
- [COLINOptimizer \(Model &model, int seed\)](#)
alternate constructor for on-the-fly instantiations
- [COLINOptimizer \(NoDBBaseConstructor, Model &model\)](#)
alternate constructor for `Iterator` instantiations by name
- [~COLINOptimizer \(\)](#)
destructor
- [void find_optimum \(\)](#)
iterates the COLIN solver to determine the optimal solution
- [bool returns_multiple_points \(\) const](#)
some COLIN methods can return multiple points

Protected Member Functions

- [void solver_setup \(Model &model\)](#)
convenience function for setting up the particular COLIN solver and appropriate Application
- [void set_rng \(int seed\)](#)
sets up the random number generator for stochastic methods
- [void set_solver_parameters \(\)](#)

sets construct-time options for specific methods based on user specifications, including calling method-specific set functions

- void `post_run` (std::ostream &s)
Get the final set of points from the solver. Look up responses and sort, first according to constraint violation, then according to function value.
- void `resize_final_points` (size_t newsize)
resize bestVariablesArray
- void `resize_final_responses` (size_t newsize)
resize bestResponseArray

Protected Attributes

- short `solverType`
COLIN solver sub-type as enumerated in COLINOptimizer.C.
- colin::SolverHandle `colinSolver`
handle to the COLIN solver
- std::pair< colin::ApplicationHandle, COLINApplication * > `colinProblem`
handle and pointer to the COLINApplication object
- colin::EvaluationManager_Base * `colinEvalMgr`
pointer to the COLIN evalutaion manager object
- utilib::RNG * `rng`
random number generator pointer
- bool `blockingSynch`
the synchronization setting: true if blocking, false if nonblocking
- Real `constraint_penalty`
Buffer to hold problem constraint_penalty parameter.
- bool `constant_penalty`
Buffer to hold problem constant_penalty parameter.

43.13.1 Detailed Description

Wrapper class for optimizers defined using COLIN. The `COLINOptimizer` class wraps COLIN, a Sandia-developed C++ optimization interface library. A variety of COLIN optimizers are defined in COLIN and its

associated libraries, including SCOLIB which contains the optimization components from the old COLINY (formerly SGOPT) library. COLIN contains optimizers such as genetic algorithms, pattern search methods, and other nongradient-based techniques. [COLINOptimizer](#) uses a [COLINApplication](#) object to perform the function evaluations.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, and `solution_accuracy` are mapped into COLIN's `max_iterations`, `max_function_evaluations_this_trial`, `function_value_tolerance`, `sufficient_objective_value` properties. An `outputLevel` is mapped to COLIN's `output_level` property and a setting of `debug` activates output of method initialization and sets the COLIN `debug` attribute to 10000 for the DEBUG output level. Refer to [Hart, W.E., 2006] for additional information on COLIN objects and controls.

43.13.2 Constructor & Destructor Documentation

43.13.2.1 COLINOptimizer (Model & *model*)

constructor Default constructor.

References `ProblemDescDB::get_int()`, `Model::init_communicators()`, `Iterator::iteratedModel`, `Optimizer::localObjectiveRecast`, `Iterator::maxConcurrency`, `Iterator::probDescDB`, `Minimizer::scaleFlag`, `COLINOptimizer::set_rng()`, `COLINOptimizer::set_solver_parameters()`, and `COLINOptimizer::solver_setup()`.

43.13.2.2 COLINOptimizer (Model & *model*, int *seed*)

alternate constructor for on-the-fly instantiations Alternate constructor for on-the-fly instantiations.

References `COLINOptimizer::set_rng()`, `COLINOptimizer::set_solver_parameters()`, and `COLINOptimizer::solver_setup()`.

43.13.2.3 COLINOptimizer (NoDBBaseConstructor, Model & *model*)

alternate constructor for [Iterator](#) instantiations by name Alternate constructor for [Iterator](#) instantiations by name.

References `COLINOptimizer::set_solver_parameters()`, and `COLINOptimizer::solver_setup()`.

43.13.3 Member Function Documentation

43.13.3.1 void find_optimum () [virtual]

iterates the COLIN solver to determine the optimal solution `find_optimum` redefines the [Optimizer](#) virtual function to perform the optimization using COLIN. It first sets up the problem data, then executes `optimize()` on the COLIN solver and finally catalogues the results.

Implements [Optimizer](#).

References `Model::asynch_flag()`, `COLINOptimizer::colinEvalMgr`, `COLINOptimizer::colinProblem`, `COLINOptimizer::colinSolver`, `COLINOptimizer::constant_penalty`, `COLINOptimizer::constraint_penalty`, `Model::continuous_variables()`, `Model::discrete_design_set_int_values()`, `Model::discrete_design_set_real_values()`, `Model::discrete_int_variables()`, `Model::discrete_real_variables()`, `Model::evaluation_capacity()`,

Iterator::iteratedModel, Iterator::numDiscreteIntVars, Iterator::numDiscreteRealVars, Iterator::outputLevel, Dakota::set_value_to_index(), and COLINOptimizer::solverType.

43.13.3.2 bool returns_multiple_points () const [virtual]

some COLIN methods can return multiple points Designate which solvers can return multiple final points.

Reimplemented from [Iterator](#).

References COLINOptimizer::solverType.

43.13.3.3 void solver_setup (Model & model) [protected]

convenience function for setting up the particular COLIN solver and appropriate Application This convenience function is called by the constructors in order to instantiate the solver.

References COLINOptimizer::colinProblem, COLINOptimizer::colinSolver, COLINOptimizer::constant_penalty, COLINOptimizer::constraint_penalty, ProblemDescDB::get_string(), Iterator::method_name(), Iterator::probDescDB, and COLINOptimizer::solverType.

Referenced by COLINOptimizer::COLINOptimizer().

43.13.3.4 void set_rng (int seed) [protected]

sets up the random number generator for stochastic methods Instantiate random number generator (RNG).

References COLINOptimizer::colinSolver, and COLINOptimizer::rng.

Referenced by COLINOptimizer::COLINOptimizer().

43.13.3.5 void set_solver_parameters () [protected]

sets construct-time options for specific methods based on user specifications, including calling method-specific set functions Sets solver properties based on user specifications. Called at construction time.

References Model::asynch_flag(), COLINOptimizer::blockingSynch, COLINOptimizer::colinSolver, COLINOptimizer::constant_penalty, COLINOptimizer::constraint_penalty, Iterator::convergenceTol, ProblemDescDB::get_bool(), ProblemDescDB::get_dsa(), ProblemDescDB::get_int(), ProblemDescDB::get_real(), ProblemDescDB::get_string(), ProblemDescDB::is_null(), Iterator::iteratedModel, Iterator::maxConcurrency, Iterator::maxFunctionEvals, Iterator::maxIterations, Iterator::numContinuousVars, Iterator::outputLevel, Iterator::probDescDB, and COLINOptimizer::solverType.

Referenced by COLINOptimizer::COLINOptimizer().

43.13.3.6 void post_run (std::ostream & s) [protected, virtual]

Get the final set of points from the solver Look up responses and sort, first according to constraint violation, then according to function value. This overrides [Optimizer::post_run\(\)](#). Do this because we need to unscale variables in order to look responses up in the database.

Reimplemented from [Optimizer](#).

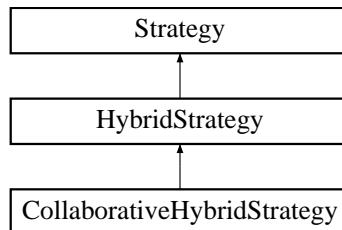

References `Iterator::bestResponseArray`, `Iterator::bestVariablesArray`, `COLINOptimizer::colinProblem`, `COLINOptimizer::colinSolver`, `Variables::continuous_variables()`, `Response::copy()`, `Variables::copy()`, `Model::current_response()`, `Model::current_variables()`, `Minimizer::cvScaleMultipliers`, `Minimizer::cvScaleOffsets`, `Minimizer::cvScaleTypes`, `Dakota::data_pairs`, `Model::discrete_design_set_int_values()`, `Model::discrete_design_set_real_values()`, `Variables::discrete_int_variable()`, `Variables::discrete_real_variable()`, `Response::function_values()`, `Model::interface_id()`, `Iterator::iteratedModel`, `Optimizer::localObjectiveRecast`, `Dakota::lookup_by_val()`, `Minimizer::modify_s2n()`, `Model::nonlinear_eq_constraint_targets()`, `Model::nonlinear_ineq_constraint_lower_bounds()`, `Model::nonlinear_ineq_constraint_upper_bounds()`, `Model::num_nonlinear_eq_constraints()`, `Model::num_nonlinear_ineq_constraints()`, `Iterator::numContinuousVars`, `Iterator::numDiscreteIntVars`, `Iterator::numFinalSolutions`, `Iterator::numFunctions`, `Minimizer::numUserPrimaryFns`, `Minimizer::objective()`, `Model::primary_response_fn_weights()`, `COLINOptimizer::resize_final_points()`, `COLINOptimizer::resize_final_responses()`, `Minimizer::scaleFlag`, `Dakota::set_index_to_value()`, `Model::subordinate_model()`, and `Minimizer::varsScaleFlag`.

The documentation for this class was generated from the following files:

- `COLINOptimizer.H`
- `COLINOptimizer.C`

43.14 CollaborativeHybridStrategy Class Reference

[Strategy](#) for hybrid minimization using multiple collaborating optimization and nonlinear least squares methods.
Inheritance diagram for CollaborativeHybridStrategy::

Public Member Functions

- [CollaborativeHybridStrategy \(ProblemDescDB &problem_db\)](#)
constructor
- [~CollaborativeHybridStrategy \(\)](#)
destructor

Protected Member Functions

- void [run_strategy \(\)](#)
Performs the collaborative hybrid minimization strategy.
- const [Variables & variables_results \(\) const](#)
return the final solution from the collaborative minimization (variables)
- const [Response & response_results \(\) const](#)
return the final solution from the collaborative minimization (response)

Private Attributes

- [String hybridCollabType](#)
abo or hops
- [Variables bestVariables](#)
best variables found in minimization
- [Response bestResponse](#)
best response found in minimization

43.14.1 Detailed Description

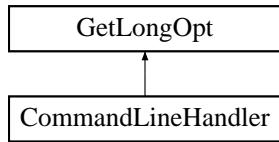

[Strategy](#) for hybrid minimization using multiple collaborating optimization and nonlinear least squares methods. This strategy has two approaches to hybrid minimization: (1) agent-based using the ABO framework; (2) nonagent-based using the HOPSPACK framework.

The documentation for this class was generated from the following files:

- CollaborativeHybridStrategy.H
- CollaborativeHybridStrategy.C

43.15 CommandLineHandler Class Reference

Utility class for managing command line inputs to DAKOTA. Inheritance diagram for CommandLineHandler::

Public Member Functions

- [CommandLineHandler \(\)](#)
default constructor; requires `check_usage()` call for parsing
- [CommandLineHandler \(int argc, char **argv\)](#)
constructor with parsing
- [~CommandLineHandler \(\)](#)
destructor
- [void check_usage \(int argc, char **argv\)](#)
Verifies that DAKOTA is called with the correct command usage. Prints a descriptive message and exits the program if incorrect.
- [int read_restart_evals \(\) const](#)
Returns the number of evaluations to be read from the restart file (as specified on the DAKOTA command line) as an integer instead of a const char.*
- [bool instantiate_flag \(\) const](#)
Whether command line args dictate instantiation of objects for run.

Private Member Functions

- [void initialize_options \(\)](#)
enrolls the supported command line inputs.
- [void output_version \(std::ostream &s\) const](#)
outputs the DAKOTA version

43.15.1 Detailed Description

Utility class for managing command line inputs to DAKOTA. [CommandLineHandler](#) provides additional functionality that is specific to DAKOTA's needs for the definition and parsing of command line options. Inheritance is used to allow the class to have all the functionality of the base class, [GetLongOpt](#).

43.15.2 Member Function Documentation

43.15.2.1 `bool instantiate_flag () const [inline]`

Whether command line args dictate instantiation of objects for run. Instantiate objects if not just getting help or version

References `GetLongOpt::retrieve()`.

Referenced by `main()`.

The documentation for this class was generated from the following files:

- `CommandLineHandler.H`
- `CommandLineHandler.C`

43.16 CommandShell Class Reference

Utility class which defines convenience operators for spawning processes with system calls.

Public Member Functions

- `CommandShell` (const std::string &work_dir)
constructor
- `~CommandShell` ()
destructor
- `CommandShell & operator<<` (const char *cmd)
appends cmd to sysCommand
- `CommandShell & operator<<` (const std::string &cmd)
convenient operator: appends string to the commandString to be executed
- `CommandShell & operator<<` (`CommandShell &(*f)(CommandShell &)`)
allows passing of the flush function to the shell using <<
- `CommandShell & flush` ()
"flushes" the shell; i.e. executes the sysCommand
- `void asynch_flag` (const bool flag)
set the asynchFlag
- `bool asynch_flag` () const
get the asynchFlag
- `void suppress_output_flag` (const bool flag)
set the suppressOutputFlag
- `bool suppress_output_flag` () const
get the suppressOutputFlag

Private Attributes

- `const std::string & workDir`
To convey working directory when useWorkdir is true::
- `std::string sysCommand`
The command string that is constructed through one or more << insertions and then executed by flush.

- bool [asynchFlag](#)
flags nonblocking operation (background system calls)
- bool [suppressOutputFlag](#)
flags suppression of shell output (no command echo)

43.16.1 Detailed Description

Utility class which defines convenience operators for spawning processes with system calls. The [CommandShell](#) class wraps the C system() utility and defines convenience operators for building a command string and then passing it to the shell.

43.16.2 Member Function Documentation

43.16.2.1 [CommandShell & operator<< \(const char * cmd\) \[inline\]](#)

appends cmd to sysCommand convenient operator: appends string to the commandString to be executed
References CommandShell::sysCommand.

43.16.2.2 [CommandShell & operator<< \(CommandShell &\)\(*CommandShell &\)f\) \[inline\]](#)

allows passing of the flush function to the shell using << convenience operator: allows passing of the flush func to the shell via <<

43.16.2.3 [CommandShell & flush \(\)](#)

"flushes" the shell; i.e. executes the sysCommand Executes the sysCommand by passing it to system(). Appends an "&" if asynchFlag is set (background system call) and echos the sysCommand to Cout if suppressOutputFlag is not set.

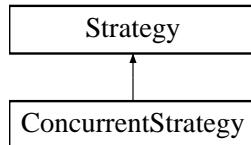

References Dakota::abort_handler(), CommandShell::asynchFlag, CommandShell::suppressOutputFlag, CommandShell::sysCommand, and CommandShell::workDir.

The documentation for this class was generated from the following files:

- CommandShell.H
- CommandShell.C

43.17 ConcurrentStrategy Class Reference

[Strategy](#) for multi-start iteration or pareto set optimization. Inheritance diagram for `ConcurrentStrategy`::

Public Member Functions

- [`ConcurrentStrategy` \(`ProblemDescDB &problem_db`\)](#)
constructor
- [`~ConcurrentStrategy \(\)`](#)
destructor

Protected Member Functions

- `void run_strategy ()`
Performs the concurrent strategy by executing selectedIterator on userDefinedModel multiple times in parallel for different settings within the iterator or model.
- `void initialize_iterator (int job_index)`
initialize the iterator about to be executed within a parallel iterator scheduling function (`serve_iterators()` or `static_schedule_iterators()`)
- `void pack_parameters_buffer (MPIPackBuffer &send_buffer, int job_index)`
pack a send_buffer for assigning an iterator job to a server
- `void unpack_parameters_buffer (MPIUnpackBuffer &recv_buffer)`
unpack a recv_buffer for accepting an iterator job from the scheduler
- `void pack_results_buffer (MPIPackBuffer &send_buffer, int job_index)`
pack a send_buffer for returning iterator results from a server
- `void unpack_results_buffer (MPIUnpackBuffer &recv_buffer, int job_index)`
unpack a recv_buffer for accepting iterator results from a server
- `void update_local_results (int job_index)`
update local PRP results arrays with current iteration results

Private Member Functions

- void `initialize_iterator` (const RealVector ¶m_set)
called by unpack_parameters_buffer(MPIUnpackBuffer) and initialize_iterator(int) to update userDefinedModel and selectedIterator
- void `print_results` () const
prints the concurrent iteration results summary (called by run_strategy())

Private Attributes

- Model `userDefinedModel`
the model used by the iterator
- Iterator `selectedIterator`
the iterator used by the concurrent strategy
- bool `multiStartFlag`
distinguishes multi-start from Pareto-set
- RealVector `initialPt`
the initial continuous variables for restoring the starting point in the Pareto set strategy
- RealVectorArray `parameterSets`
an array of parameter set vectors (either multistart variable sets or pareto multi-objective/least squares weighting sets) to be performed.
- PRPArray `pprResults`
1-d array of ParamResponsePair results corresponding to numIteratorJobs

43.17.1 Detailed Description

Strategy for multi-start iteration or pareto set optimization. This strategy maintains two concurrent iterator capabilities. First, a general capability for running an iterator multiple times from different starting points is provided (often used for multi-start optimization, but not restricted to optimization). Second, a simple capability for mapping the "pareto frontier" (the set of optimal solutions in multiobjective formulations) is provided. This pareto set is mapped through running an optimizer multiple times for different sets of multiobjective weightings.

43.17.2 Member Function Documentation

43.17.2.1 void pack_parameters_buffer (MPIPackBuffer & send_buffer, int job_index) [inline, protected, virtual]

pack a send_buffer for assigning an iterator job to a server This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.

Reimplemented from [Strategy](#).

References ConcurrentStrategy::parameterSets.

43.17.2.2 void unpack_parameters_buffer (MPIUnpackBuffer & *recv_buffer*) [inline, protected, virtual]

unpack a recv_buffer for accepting an iterator job from the scheduler This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.

Reimplemented from [Strategy](#).

References ConcurrentStrategy::initialize_iterator().

43.17.2.3 void pack_results_buffer (MPIPackBuffer & *send_buffer*, int *job_index*) [inline, protected, virtual]

pack a send_buffer for returning iterator results from a server This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.

Reimplemented from [Strategy](#).

References ConcurrentStrategy::prpResults.

43.17.2.4 void unpack_results_buffer (MPIUnpackBuffer & *recv_buffer*, int *job_index*) [inline, protected, virtual]

unpack a recv_buffer for accepting iterator results from a server This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).

Reimplemented from [Strategy](#).

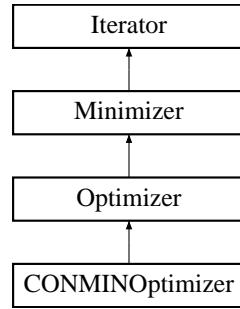

References ConcurrentStrategy::prpResults.

The documentation for this class was generated from the following files:

- ConcurrentStrategy.H
- ConcurrentStrategy.C

43.18 CONMINOptimizer Class Reference

Wrapper class for the CONMIN optimization library. Inheritance diagram for CONMINOptimizer::

Public Member Functions

- [CONMINOptimizer \(Model &model\)](#)
standard constructor
- [CONMINOptimizer \(NoDBBaseConstructor, Model &model\)](#)
alternate constructor
- [~CONMINOptimizer \(\)](#)
destructor
- [void find_optimum \(\)](#)
Used within the optimizer branch for computing the optimal solution. Redefines the run virtual function for the optimizer branch.

Protected Member Functions

- [void initialize_run \(\)](#)
performs run-time set up

Private Member Functions

- [void initialize \(\)](#)
Shared constructor code.
- [void allocate_workspace \(\)](#)
Allocates workspace for the optimizer.

- void `deallocate_workspace ()`
Releases workspace memory.
- void `allocate_constraints ()`
Allocates constraint mappings.

Private Attributes

- int `conminInfo`
INFO from CONMIN manual.
- int `printControl`
IPRINT from CONMIN manual (controls output verbosity).
- int `optimizationType`
MINMAX from DOT manual (minimize or maximize).
- Real `objFnValue`
value of the objective function passed to CONMIN
- RealVector `constraintValues`
array of nonlinear constraint values passed to CONMIN
- int `numConminNInConstr`
total number of nonlinear constraints seen by CONMIN
- int `numConminLinConstr`
total number of linear constraints seen by CONMIN
- int `numConminConstr`
total number of linear and nonlinear constraints seen by CONMIN
- SizetArray `constraintMappingIndices`
a container of indices for referencing the corresponding `Response` constraints used in computing the CONMIN constraints.
- RealArray `constraintMappingMultipliers`
a container of multipliers for mapping the `Response` constraints to the CONMIN constraints.
- RealArray `constraintMappingOffsets`
a container of offsets for mapping the `Response` constraints to the CONMIN constraints.
- int `N1`
Size variable for CONMIN arrays. See CONMIN manual.

- int **N2**
Size variable for CONMIN arrays. See CONMIN manual.
- int **N3**
Size variable for CONMIN arrays. See CONMIN manual.
- int **N4**
Size variable for CONMIN arrays. See CONMIN manual.
- int **N5**
Size variable for CONMIN arrays. See CONMIN manual.
- int **NFDG**
Finite difference flag.
- int **IPRINT**
Flag to control amount of output data.
- int **ITMAX**
Flag to specify the maximum number of iterations.
- double **FDCH**
Relative finite difference step size.
- double **FDCHM**
Absolute finite difference step size.
- double **CT**
Constraint thickness parameter.
- double **CTMIN**
Minimum absolute value of CT used during optimization.
- double **CTL**
Constraint thickness parameter for linear and side constraints.
- double **CTLMIN**
Minimum value of CTL used during optimization.
- double **DELFUN**
Relative convergence criterion threshold.
- double **DABFUN**
Absolute convergence criterion threshold.
- double * **conminDesVars**

Array of design variables used by CONMIN (length NI = numdv+2).

- double * [conminLowerBnds](#)

Array of lower bounds used by CONMIN (length NI = numdv+2).

- double * [conminUpperBnds](#)

Array of upper bounds used by CONMIN (length NI = numdv+2).

- double * [S](#)

Internal CONMIN array.

- double * [G1](#)

Internal CONMIN array.

- double * [G2](#)

Internal CONMIN array.

- double * [B](#)

Internal CONMIN array.

- double * [C](#)

Internal CONMIN array.

- int * [MS1](#)

Internal CONMIN array.

- double * [SCAL](#)

Internal CONMIN array.

- double * [DF](#)

Internal CONMIN array.

- double * [A](#)

Internal CONMIN array.

- int * [ISC](#)

Internal CONMIN array.

- int * [IC](#)

Internal CONMIN array.

43.18.1 Detailed Description

Wrapper class for the CONMIN optimization library. The [CONMINOptimizer](#) class provides a wrapper for CONMIN, a Public-domain Fortran 77 optimization library written by Gary Vanderplaats under contract to NASA Ames Research Center. The CONMIN User's Manual is contained in NASA Technical Memorandum X-62282, 1978. CONMIN uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see [NPSOLOptimizer](#) and [SNLLOptimizer](#)).

The user input mappings are as follows: `max_iterations` is mapped into CONMIN's `ITMAX` parameter, `max_function_evaluations` is implemented directly in the `find_optimum()` loop since there is no CONMIN parameter equivalent, `convergence_tolerance` is mapped into CONMIN's `DELFUN` and `DABFUN` parameters, `output` verbosity is mapped into CONMIN's `IPRINT` parameter (verbose: `IPRINT = 4`; quiet: `IPRINT = 2`), gradient mode is mapped into CONMIN's `NFDG` parameter, and finite difference step size is mapped into CONMIN's `FDCH` and `FDCHM` parameters. Refer to [Vanderplaats, 1978] for additional information on CONMIN parameters.

43.18.2 Member Data Documentation

43.18.2.1 int comminInfo [private]

INFO from CONMIN manual. Information requested by CONMIN: 1 = evaluate objective and constraints, 2 = evaluate gradients of objective and constraints.

Referenced by `CONMINOptimizer::find_optimum()`, and `CONMINOptimizer::initialize()`.

43.18.2.2 int printControl [private]

`IPRINT` from CONMIN manual (controls output verbosity). Values range from 0 (nothing) to 4 (most output). 0 = nothing, 1 = initial and final function information, 2 = all of #1 plus function value and design vars at each iteration, 3 = all of #2 plus constraint values and direction vectors, 4 = all of #3 plus gradients of the objective function and constraints, 5 = all of #4 plus proposed design vector, plus objective and constraint functions from the 1-D search

Referenced by `CONMINOptimizer::initialize()`.

43.18.2.3 int optimizationType [private]

`MINMAX` from DOT manual (minimize or maximize). Values of 0 or -1 (minimize) or 1 (maximize).

43.18.2.4 RealVector constraintValues [private]

array of nonlinear constraint values passed to CONMIN This array must be of nonzero length and must contain only one-sided inequality constraints which are ≤ 0 (which requires a transformation from 2-sided inequalities and equalities).

Referenced by `CONMINOptimizer::allocate_workspace()`, and `CONMINOptimizer::find_optimum()`.

43.18.2.5 SizetArray constraintMappingIndices [private]

a container of indices for referencing the corresponding [Response](#) constraints used in computing the CONMIN constraints. The length of the container corresponds to the number of CONMIN constraints, and each entry in the container points to the corresponding DAKOTA constraint.

Referenced by CONMINOptimizer::allocate_constraints(), and CONMINOptimizer::find_optimum().

43.18.2.6 RealArray constraintMappingMultipliers [private]

a container of multipliers for mapping the [Response](#) constraints to the CONMIN constraints. The length of the container corresponds to the number of CONMIN constraints, and each entry in the container stores a multiplier for the DAKOTA constraint identified with constraintMappingIndices. These multipliers are currently +1 or -1.

Referenced by CONMINOptimizer::allocate_constraints(), and CONMINOptimizer::find_optimum().

43.18.2.7 RealArray constraintMappingOffsets [private]

a container of offsets for mapping the [Response](#) constraints to the CONMIN constraints. The length of the container corresponds to the number of CONMIN constraints, and each entry in the container stores an offset for the DAKOTA constraint identified with constraintMappingIndices. These offsets involve inequality bounds or equality targets, since CONMIN assumes constraint allowables = 0.

Referenced by CONMINOptimizer::allocate_constraints(), and CONMINOptimizer::find_optimum().

43.18.2.8 int N1 [private]

Size variable for CONMIN arrays. See CONMIN manual. N1 = number of variables + 2

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::find_optimum(), and CONMINOptimizer::initialize_run().

43.18.2.9 int N2 [private]

Size variable for CONMIN arrays. See CONMIN manual. N2 = number of constraints + 2*(number of variables)

Referenced by CONMINOptimizer::allocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.10 int N3 [private]

Size variable for CONMIN arrays. See CONMIN manual. N3 = Maximum possible number of active constraints.

Referenced by CONMINOptimizer::allocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.11 int N4 [private]

Size variable for CONMIN arrays. See CONMIN manual. N4 = Maximum(N3,number of variables)

Referenced by CONMINOptimizer::allocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.12 int N5 [private]

Size variable for CONMIN arrays. See CONMIN manual. $N5 = 2*(N4)$

Referenced by CONMINOptimizer::allocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.13 double CT [private]

Constraint thickness parameter. The value of CT decreases in magnitude during optimization.

Referenced by CONMINOptimizer::find_optimum(), and CONMINOptimizer::initialize().

43.18.2.14 double* S [private]

Internal CONMIN array. Move direction in N-dimensional space.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.15 double* G1 [private]

Internal CONMIN array. Temporary storage of constraint values.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.16 double* G2 [private]

Internal CONMIN array. Temporary storage of constraint values.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.17 double* B [private]

Internal CONMIN array. Temporary storage for computations involving array S.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.18 double* C [private]

Internal CONMIN array. Temporary storage for use with arrays B and S.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.19 int* MS1 [private]

Internal CONMIN array. Temporary storage for use with arrays B and S.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.20 double* SCAL [private]

Internal CONMIN array. Vector of scaling parameters for design parameter values.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.21 double* DF [private]

Internal CONMIN array. Temporary storage for analytic gradient data.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.22 double* A [private]

Internal CONMIN array. Temporary 2-D array for storage of constraint gradients.

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), and CONMINOptimizer::find_optimum().

43.18.2.23 int* ISC [private]

Internal CONMIN array. Array of flags to identify linear constraints. (not used in this implementation of CONMIN)

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), CONMINOptimizer::find_optimum(), and CONMINOptimizer::initialize_run().

43.18.2.24 int* IC [private]

Internal CONMIN array. Array of flags to identify active and violated constraints

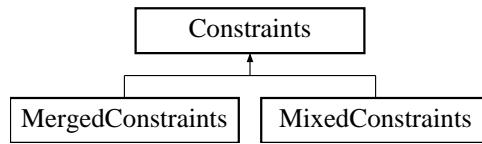

Referenced by CONMINOptimizer::allocate_workspace(), CONMINOptimizer::deallocate_workspace(), CONMINOptimizer::find_optimum(), and CONMINOptimizer::initialize_run().

43.19 Constraints Class Reference

Base class for the variable constraints class hierarchy. Inheritance diagram for Constraints::

Public Member Functions

- **Constraints ()**
default constructor
- **Constraints (const ProblemDescDB &prob_db, const SharedVariablesData &svd)**
standard constructor
- **Constraints (const SharedVariablesData &svd)**
alternate constructor for instantiations on the fly
- **Constraints (const Constraints &con)**
copy constructor
- **virtual ~Constraints ()**
destructor
- **Constraints operator= (const Constraints &con)**
assignment operator
- **virtual void write (std::ostream &s) const**
write a variable constraints object to an std::ostream
- **virtual void read (std::istream &s)**
read a variable constraints object from an std::istream
- **virtual void reshape (const SizetArray &vc_totals)**
reshape the lower/upper bound arrays within the [Constraints](#) hierarchy
- **const RealVector & continuous_lower_bounds () const**
return the active continuous variable lower bounds
- **void continuous_lower_bounds (const RealVector &cl_bnds)**
set the active continuous variable lower bounds

- void [continuous_lower_bound](#) (const Real &cl_bnd, const size_t &i)
set an active continuous variable lower bound
- const RealVector & [continuous_upper_bounds](#) () const
return the active continuous variable upper bounds
- void [continuous_upper_bounds](#) (const RealVector &cu_bnds)
set the active continuous variable upper bounds
- void [continuous_upper_bound](#) (const Real &cu_bnd, const size_t &i)
set an active continuous variable upper bound
- const IntVector & [discrete_int_lower_bounds](#) () const
return the active discrete variable lower bounds
- void [discrete_int_lower_bounds](#) (const IntVector &dil_bnds)
set the active discrete variable lower bounds
- void [discrete_int_lower_bound](#) (const int &dil_bnd, const size_t &i)
set an active discrete variable lower bound
- const IntVector & [discrete_int_upper_bounds](#) () const
return the active discrete variable upper bounds
- void [discrete_int_upper_bounds](#) (const IntVector &diu_bnds)
set the active discrete variable upper bounds
- void [discrete_int_upper_bound](#) (const int &diu_bnd, const size_t &i)
set an active discrete variable upper bound
- const RealVector & [discrete_real_lower_bounds](#) () const
return the active discrete variable lower bounds
- void [discrete_real_lower_bounds](#) (const RealVector &drl_bnds)
set the active discrete variable lower bounds
- void [discrete_real_lower_bound](#) (const Real &drl_bnd, const size_t &i)
set an active discrete variable lower bound
- const RealVector & [discrete_real_upper_bounds](#) () const
return the active discrete variable upper bounds
- void [discrete_real_upper_bounds](#) (const RealVector &dru_bnds)
set the active discrete variable upper bounds
- void [discrete_real_upper_bound](#) (const Real &dru_bnd, const size_t &i)

set an active discrete variable upper bound

- const RealVector & **inactive_continuous_lower_bounds** () const
return the inactive continuous lower bounds
- void **inactive_continuous_lower_bounds** (const RealVector &icl_bnds)
set the inactive continuous lower bounds
- const RealVector & **inactive_continuous_upper_bounds** () const
return the inactive continuous upper bounds
- void **inactive_continuous_upper_bounds** (const RealVector &icu_bnds)
set the inactive continuous upper bounds
- const IntVector & **inactive_discrete_int_lower_bounds** () const
return the inactive discrete lower bounds
- void **inactive_discrete_int_lower_bounds** (const IntVector &idil_bnds)
set the inactive discrete lower bounds
- const IntVector & **inactive_discrete_int_upper_bounds** () const
return the inactive discrete upper bounds
- void **inactive_discrete_int_upper_bounds** (const IntVector &idiu_bnds)
set the inactive discrete upper bounds
- const RealVector & **inactive_discrete_real_lower_bounds** () const
return the inactive discrete lower bounds
- void **inactive_discrete_real_lower_bounds** (const RealVector &idrl_bnds)
set the inactive discrete lower bounds
- const RealVector & **inactive_discrete_real_upper_bounds** () const
return the inactive discrete upper bounds
- void **inactive_discrete_real_upper_bounds** (const RealVector &idru_bnds)
set the inactive discrete upper bounds
- const RealVector & **all_continuous_lower_bounds** () const
returns a single array with all continuous lower bounds
- void **all_continuous_lower_bounds** (const RealVector &acl_bnds)
sets all continuous lower bounds using a single array
- void **all_continuous_lower_bound** (const Real &acl_bnd, const size_t &i)
set a lower bound within the all continuous lower bounds array

- `const RealVector & all_continuous_upper_bounds () const`
returns a single array with all continuous upper bounds
- `void all_continuous_upper_bounds (const RealVector &acu_bnds)`
sets all continuous upper bounds using a single array
- `void all_continuous_upper_bound (const Real &acu_bnd, const size_t &i)`
set an upper bound within the all continuous upper bounds array
- `const IntVector & all_discrete_int_lower_bounds () const`
returns a single array with all discrete lower bounds
- `void all_discrete_int_lower_bounds (const IntVector &adil_bnds)`
sets all discrete lower bounds using a single array
- `void all_discrete_int_lower_bound (const int &adil_bnd, const size_t &i)`
set a lower bound within the all discrete lower bounds array
- `const IntVector & all_discrete_int_upper_bounds () const`
returns a single array with all discrete upper bounds
- `void all_discrete_int_upper_bounds (const IntVector &adiu_bnds)`
sets all discrete upper bounds using a single array
- `void all_discrete_int_upper_bound (const int &adiu_bnd, const size_t &i)`
set an upper bound within the all discrete upper bounds array
- `const RealVector & all_discrete_real_lower_bounds () const`
returns a single array with all discrete lower bounds
- `void all_discrete_real_lower_bounds (const RealVector &adrl_bnds)`
sets all discrete lower bounds using a single array
- `void all_discrete_real_lower_bound (const Real &adrl_bnd, const size_t &i)`
set a lower bound within the all discrete lower bounds array
- `const RealVector & all_discrete_real_upper_bounds () const`
returns a single array with all discrete upper bounds
- `void all_discrete_real_upper_bounds (const RealVector &adru_bnds)`
sets all discrete upper bounds using a single array
- `void all_discrete_real_upper_bound (const Real &adru_bnd, const size_t &i)`
set an upper bound within the all discrete upper bounds array

- `size_t num_linear_ineq_constraints () const`
return the number of linear inequality constraints
- `size_t num_linear_eq_constraints () const`
return the number of linear equality constraints
- `const RealMatrix & linear_ineq_constraint_coeffs () const`
return the linear inequality constraint coefficients
- `void linear_ineq_constraint_coeffs (const RealMatrix &lin_ineq_coeffs)`
set the linear inequality constraint coefficients
- `const RealVector & linear_ineq_constraint_lower_bounds () const`
return the linear inequality constraint lower bounds
- `void linear_ineq_constraint_lower_bounds (const RealVector &lin_ineq_l_bnds)`
set the linear inequality constraint lower bounds
- `const RealVector & linear_ineq_constraint_upper_bounds () const`
return the linear inequality constraint upper bounds
- `void linear_ineq_constraint_upper_bounds (const RealVector &lin_ineq_u_bnds)`
set the linear inequality constraint upper bounds
- `const RealMatrix & linear_eq_constraint_coeffs () const`
return the linear equality constraint coefficients
- `void linear_eq_constraint_coeffs (const RealMatrix &lin_eq_coeffs)`
set the linear equality constraint coefficients
- `const RealVector & linear_eq_constraint_targets () const`
return the linear equality constraint targets
- `void linear_eq_constraint_targets (const RealVector &lin_eq_targets)`
set the linear equality constraint targets
- `size_t num_nonlinear_ineq_constraints () const`
return the number of nonlinear inequality constraints
- `size_t num_nonlinear_eq_constraints () const`
return the number of nonlinear equality constraints
- `const RealVector & nonlinear_ineq_constraint_lower_bounds () const`
return the nonlinear inequality constraint lower bounds
- `void nonlinear_ineq_constraint_lower_bounds (const RealVector &nln_ineq_l_bnds)`

set the nonlinear inequality constraint lower bounds

- const RealVector & [nonlinear_ineq_constraint_upper_bounds](#) () const
return the nonlinear inequality constraint upper bounds
- void [nonlinear_ineq_constraint_upper_bounds](#) (const RealVector &nln_ineq_u_bnds)
set the nonlinear inequality constraint upper bounds
- const RealVector & [nonlinear_eq_constraint_targets](#) () const
return the nonlinear equality constraint targets
- void [nonlinear_eq_constraint_targets](#) (const RealVector &nln_eq_targets)
set the nonlinear equality constraint targets
- [Constraints copy](#) () const
for use when a deep copy is needed (the representation is _not_ shared)
- void [reshape](#) (const size_t &num_nln_ineq_cons, const size_t &num_nln_eq_cons, const size_t &num_lin_ineq_cons, const size_t &num_lin_eq_cons, const SizetArray &vc_totals)
reshape the linear/nonlinear/bound constraint arrays arrays within the [Constraints](#) hierarchy
- void [reshape](#) (const size_t &num_nln_ineq_cons, const size_t &num_nln_eq_cons, const size_t &num_lin_ineq_cons, const size_t &num_lin_eq_cons)
reshape the linear/nonlinear constraint arrays within the [Constraints](#) hierarchy
- void [inactive_view](#) (short view2)
sets the inactive view based on higher level (nested) context
- bool [is_null](#) () const
function to check constraintsRep (does this envelope contain a letter)

Protected Member Functions

- [Constraints](#) ([BaseConstructor](#), const [ProblemDescDB](#) &problem_db, const [SharedVariablesData](#) &svd)
constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
- [Constraints](#) ([BaseConstructor](#), const [SharedVariablesData](#) &svd)
constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
- virtual void [build_active_views](#) ()
construct active views of all variables bounds arrays
- virtual void [build_inactive_views](#) ()

construct inactive views of all variables bounds arrays

- void `build_views()`

construct active/inactive views of all variables arrays

- void `manage_linear_constraints(const ProblemDescDB &problem_db)`

perform checks on user input, convert linear constraint coefficient input to matrices, and assign defaults

Protected Attributes

- SharedVariablesData `sharedVarsData`

configuration data shared from a `Variables` instance

- RealVector `allContinuousLowerBnds`

a continuous lower bounds array combining continuous design, uncertain, and continuous state variable types (all view).

- RealVector `allContinuousUpperBnds`

a continuous upper bounds array combining continuous design, uncertain, and continuous state variable types (all view).

- IntVector `allDiscreteIntLowerBnds`

a discrete lower bounds array combining discrete design and discrete state variable types (all view).

- IntVector `allDiscreteIntUpperBnds`

a discrete upper bounds array combining discrete design and discrete state variable types (all view).

- RealVector `allDiscreteRealLowerBnds`

a discrete lower bounds array combining discrete design and discrete state variable types (all view).

- RealVector `allDiscreteRealUpperBnds`

a discrete upper bounds array combining discrete design and discrete state variable types (all view).

- size_t `numNonlinearIneqCons`

number of nonlinear inequality constraints

- size_t `numNonlinearEqCons`

number of nonlinear equality constraints

- RealVector `nonlinearIneqConLowerBnds`

nonlinear inequality constraint lower bounds

- RealVector `nonlinearIneqConUpperBnds`

nonlinear inequality constraint upper bounds

- RealVector [nonlinearEqConTargets](#)
nonlinear equality constraint targets
- size_t [numLinearIneqCons](#)
number of linear inequality constraints
- size_t [numLinearEqCons](#)
number of linear equality constraints
- RealMatrix [linearIneqConCoeffs](#)
linear inequality constraint coefficients
- RealMatrix [linearEqConCoeffs](#)
linear equality constraint coefficients
- RealVector [linearIneqConLowerBnds](#)
linear inequality constraint lower bounds
- RealVector [linearIneqConUpperBnds](#)
linear inequality constraint upper bounds
- RealVector [linearEqConTargets](#)
linear equality constraint targets
- RealVector [continuousLowerBnds](#)
the active continuous lower bounds array view
- RealVector [continuousUpperBnds](#)
the active continuous upper bounds array view
- IntVector [discreteIntLowerBnds](#)
the active discrete lower bounds array view
- IntVector [discreteIntUpperBnds](#)
the active discrete upper bounds array view
- RealVector [discreteRealLowerBnds](#)
the active discrete lower bounds array view
- RealVector [discreteRealUpperBnds](#)
the active discrete upper bounds array view
- RealVector [inactiveContinuousLowerBnds](#)
the inactive continuous lower bounds array view
- RealVector [inactiveContinuousUpperBnds](#)

the inactive continuous upper bounds array view

- IntVector [inactiveDiscreteIntLowerBnds](#)
the inactive discrete lower bounds array view
- IntVector [inactiveDiscreteIntUpperBnds](#)
the inactive discrete upper bounds array view
- RealVector [inactiveDiscreteRealLowerBnds](#)
the inactive discrete lower bounds array view
- RealVector [inactiveDiscreteRealUpperBnds](#)
the inactive discrete upper bounds array view

Private Member Functions

- [Constraints * get_constraints](#) (const [ProblemDescDB](#) &problem_db, const [SharedVariablesData](#) &svd)
Used only by the constructor to initialize constraintsRep to the appropriate derived type.
- [Constraints * get_constraints](#) (const [SharedVariablesData](#) &svd) const
Used by [copy\(\)](#) to initialize constraintsRep to the appropriate derived type.

Private Attributes

- [Constraints * constraintsRep](#)
pointer to the letter (initialized only for the envelope)
- int [referenceCount](#)
number of objects sharing constraintsRep

43.19.1 Detailed Description

Base class for the variable constraints class hierarchy. The [Constraints](#) class is the base class for the class hierarchy managing bound, linear, and nonlinear constraints. Using the variable lower and upper bounds arrays from the input specification, different derived classes define different views of this data. The linear and nonlinear constraint data is consistent in all views and is managed at the base class level. For memory efficiency and enhanced polymorphism, the variable constraints hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Constraints](#)) serves as the envelope and one of the derived classes (selected in [Constraints::get_constraints\(\)](#)) serves as the letter.

43.19.2 Constructor & Destructor Documentation

43.19.2.1 Constraints ()

default constructor The default constructor: constraintsRep is NULL in this case (a populated problem_db is needed to build a meaningful [Constraints](#) object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

43.19.2.2 Constraints (`const ProblemDescDB & problem_db, const SharedVariablesData & svd`)

standard constructor The envelope constructor only needs to extract enough data to properly execute get_constraints, since the constructor overloaded with [BaseConstructor](#) builds the actual base class data inherited by the derived classes.

References Dakota::abort_handler(), [Constraints::constraintsRep](#), and [Constraints::get_constraints\(\)](#).

43.19.2.3 Constraints (`const SharedVariablesData & svd`)

alternate constructor for instantiations on the fly Envelope constructor for instantiations on the fly. This constructor executes get_constraints(view), which invokes the default derived/base constructors, followed by a [reshape\(\)](#) based on vars_comps.

References Dakota::abort_handler(), [Constraints::constraintsRep](#), and [Constraints::get_constraints\(\)](#).

43.19.2.4 Constraints (`const Constraints & con`)

copy constructor Copy constructor manages sharing of constraintsRep and incrementing of referenceCount.

References [Constraints::constraintsRep](#), and [Constraints::referenceCount](#).

43.19.2.5 ~Constraints () [virtual]

destructor Destructor decrements referenceCount and only deletes constraintsRep when referenceCount reaches zero.

References [Constraints::constraintsRep](#), and [Constraints::referenceCount](#).

43.19.2.6 Constraints (`BaseConstructor, const ProblemDescDB & problem_db, const SharedVariablesData & svd`) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get_constraints\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling [get_constraints\(\)](#) again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Constraints).

43.19.2.7 Constraints (BaseConstructor, const SharedVariablesData & svd) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get_constraints\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling [get_constraints\(\)](#) again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Constraints).

43.19.3 Member Function Documentation**43.19.3.1 Constraints operator= (const Constraints & con)**

assignment operator Assignment operator decrements referenceCount for old constraintsRep, assigns new constraintsRep, and increments referenceCount for new constraintsRep.

References Constraints::constraintsRep, and Constraints::referenceCount.

43.19.3.2 void reshape (const SizetArray & vc_totals) [virtual]

reshape the lower/upper bound arrays within the [Constraints](#) hierarchy Resizes the derived bounds arrays.

Reimplemented in [MergedConstraints](#), and [MixedConstraints](#).

References Constraints::constraintsRep, Constraints::continuousLowerBnds, Constraints::discreteIntLowerBnds, Constraints::discreteRealLowerBnds, Constraints::linearEqConCoeffs, Constraints::linearIneqConCoeffs, Constraints::numLinearEqCons, Constraints::numLinearIneqCons, and Constraints::reshape().

Referenced by DataFitSurrModel::DataFitSurrModel(), RecastModel::RecastModel(), and Constraints::reshape().

43.19.3.3 Constraints copy () const

for use when a deep copy is needed (the representation is _not_ shared) Deep copies are used for history mechanisms that catalogue permanent copies (should not change as the representation within userDefinedConstraints changes).

References Constraints::allContinuousLowerBnds, Constraints::allContinuousUpperBnds, Constraints::allDiscreteIntLowerBnds, Constraints::allDiscreteIntUpperBnds, Constraints::allDiscreteRealLowerBnds, Constraints::allDiscreteRealUpperBnds, Constraints::build_views(), Constraints::constraintsRep, Constraints::get_constraints(), Constraints::linearEqConCoeffs, Constraints::linearEqConTargets, Constraints::linearIneqConCoeffs, Constraints::linearIneqConLowerBnds, Constraints::linearIneqConUpperBnds, Constraints::nonlinearEqConTargets, Constraints::nonlinearIneqConLowerBnds, Constraints::nonlinearIneqConUpperBnds, Constraints::numLinearEqCons, Constraints::numLinearIneqCons, Constraints::numNonlinearEqCons, Constraints::numNonlinearIneqCons, and Constraints::sharedVarsData.

Referenced by SurrogateModel::force_rebuild(), and RecastModel::RecastModel().

43.19.3.4 void reshape (const size_t & num_nln_ineq_cons, const size_t & num_nln_eq_cons, const size_t & num_lin_ineq_cons, const size_t & num_lin_eq_cons)

reshape the linear/nonlinear constraint arrays within the [Constraints](#) hierarchy Resizes the linear and nonlinear constraint arrays at the base class. Does NOT currently resize the derived bounds arrays.

References Constraints::constraintsRep, Constraints::linearEqConTargets, Constraints::linearIneqConLowerBnds, Constraints::linearIneqConUpperBnds, Constraints::nonlinearEqConTargets, Constraints::nonlinearIneqConLowerBnds, Constraints::nonlinearIneqConUpperBnds, Constraints::numLinearEqCons, Constraints::numLinearIneqCons, Constraints::numNonlinearEqCons, Constraints::numNonlinearIneqCons, and Constraints::reshape().

43.19.3.5 void build_views () [inline, protected]

construct active/inactive views of all variables arrays

= EMPTY)

= EMPTY)

References Constraints::build_active_views(), Constraints::build_inactive_views(), Constraints::sharedVarsData, and SharedVariablesData::view().

Referenced by Constraints::copy(), MergedConstraints::MergedConstraints(), MixedConstraints::MixedConstraints(), MixedConstraints::reshape(), and MergedConstraints::reshape().

43.19.3.6 void manage_linear_constraints (const ProblemDescDB & problem_db) [protected]

perform checks on user input, convert linear constraint coefficient input to matrices, and assign defaults Convenience function called from derived class constructors. The number of variables active for applying linear constraints is currently defined to be the number of active continuous variables plus the number of active discrete variables (the most general case), even though very few optimizers can currently support mixed variable linear constraints.

References Dakota::abort_handler(), Constraints::continuousLowerBnds, Dakota::copy_data(), Constraints::discreteIntLowerBnds, Constraints::discreteRealLowerBnds, ProblemDescDB::get_rdv(), Constraints::linearEqConCoeffs, Constraints::linearEqConTargets, Constraints::linearIneqConCoeffs, Constraints::linearIneqConLowerBnds, Constraints::linearIneqConUpperBnds, Constraints::numLinearEqCons, and Constraints::numLinearIneqCons.

Referenced by MergedConstraints::MergedConstraints(), and MixedConstraints::MixedConstraints().

43.19.3.7 Constraints * get_constraints (const ProblemDescDB & problem_db, const SharedVariablesData & svd) [private]

Used only by the constructor to initialize constraintsRep to the appropriate derived type. Initializes constraintsRep to the appropriate derived type, as given by the variables view.

References SharedVariablesData::view().

Referenced by Constraints::Constraints(), and Constraints::copy().

43.19.3.8 Constraints * get_constraints (const SharedVariablesData & svd) const [private]

Used by [copy\(\)](#) to initialize constraintsRep to the appropriate derived type. Initializes constraintsRep to the appropriate derived type, as given by the variables view. The default derived class constructors are invoked.

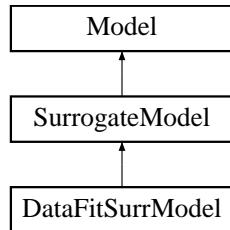

References SharedVariablesData::view().

*selects parameter sets on which to evaluate actualModel in order to generate the necessary data for building global approximations (optional for global since restart data may also be used)*

### 43.20.1 Detailed Description

Derived model class within the surrogate model branch for managing data fit surrogates (global and local). The [DataFitSurrModel](#) class manages global or local approximations (surrogates that involve data fits) that are used in place of an expensive model. The class contains an approxInterface (required for both global and local) which manages the approximate function evaluations, an actualModel (optional for global, required for local) which provides truth evaluations for building the surrogate, and a daceIterator (optional for global, not used for local) which selects parameter sets on which to evaluate actualModel in order to generate the necessary data for building global approximations.

### 43.20.2 Member Function Documentation

#### 43.20.2.1 void derived\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [compute\\_response\(\)](#) specific to [DataFitSurrModel](#) Compute the response synchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed, evaluate the approximate response, and apply correction (if active) to the results.

Reimplemented from [Model](#).

References DiscrepancyCorrection::active(), Response::active\_set(), DataFitSurrModel::actualModel, DiscrepancyCorrection::apply(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, SurrogateModel::asv\_mapping(), DataFitSurrModel::build\_approximation(), DataFitSurrModel::component\_parallel\_mode(), DiscrepancyCorrection::compute(), Model::compute\_response(), Variables::continuous\_variables(), Response::copy(), Model::current\_response(), Model::currentResponse, Model::currentVariables, SurrogateModel::deltaCorr, SurrogateModel::force\_rebuild(), Interface::map(), Model::outputLevel, ActiveSet::request\_vector(), SurrogateModel::response\_mapping(), SurrogateModel::responseMode, DataFitSurrModel::surrModelEvalCntr, Response::update(), and DataFitSurrModel::update\_actual\_model().

#### 43.20.2.2 void derived\_asynch\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [asynch\\_compute\\_response\(\)](#) specific to [DataFitSurrModel](#) Compute the response asynchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed and evaluate the approximate response in a quasi-asynchronous approach ([ApproximationInterface::map\(\)](#) performs the map synchronously and bookkeeps the results for return in [derived\\_synchronize\(\)](#) below).

Reimplemented from [Model](#).

nowait(), and SurrogateModel::truthIdMap.

#### **43.20.2.5 void build\_approximation () [protected, virtual]**

Builds the local/multipoint/global approximation using daceIterator/actualModel to generate new data points. This function constructs a new approximation, discarding any previous data. It constructs any required data for SurrogateData:{ vars,resp }Data and does not define an anchor point for SurrogateData::anchor{ Vars,Resp }.

Reimplemented from [Model](#).

References DataFitSurrModel::actualModel, SurrogateModel::approxBuilds, DataFitSur-  
rModel::approxInterface, Interface::build\_approximation(), DataFitSurrModel::build\_global(),

DataFitSurrModel::build\_local\_multipoint(), Interface::clear\_current(), Model::continuous\_lower\_bounds(), Constraints::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Constraints::continuous\_upper\_bounds(), Model::is\_null(), Model::surrogateType, DataFitSurrModel::update\_actual\_model(), DataFitSurrModel::update\_global(), DataFitSurrModel::update\_local\_multipoint(), and Model::userDefinedConstraints.

Referenced by DataFitSurrModel::derived\_asynch\_compute\_response(), and DataFitSurrModel::derived\_compute\_response().

#### **43.20.2.6 bool build\_approximation (const Variables & vars, const IntResponsePair & response\_pr) [protected, virtual]**

Builds the local/multipoint/global approximation using daceIterator/actualModel to generate new data points that augment the vars/response anchor point. This function constructs a new approximation, discarding any previous data. It uses the passed data to populate SurrogateData::anchor{Vars,Resp} and constructs any required data points for SurrogateData::{vars,resp}Data.

Reimplemented from [Model](#).

References DataFitSurrModel::actualModel, SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Interface::build\_approximation(), DataFitSurrModel::build\_global(), Interface::clear\_current(), Model::continuous\_lower\_bounds(), Constraints::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Constraints::continuous\_upper\_bounds(), Model::is\_null(), Model::surrogateType, DataFitSurrModel::update\_actual\_model(), Interface::update\_approximation(), DataFitSurrModel::update\_global(), DataFitSurrModel::update\_local\_multipoint(), and Model::userDefinedConstraints.

#### **43.20.2.7 void update\_approximation (bool rebuild\_flag) [protected, virtual]**

replaces the approximation data with daceIterator results and rebuilds the approximation if requested. This function populates/replaces SurrogateData::anchor{Vars,Resp} and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::{vars,resp}Data) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References Iterator::all\_responses(), Iterator::all\_samples(), Iterator::all\_variables(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Iterator::compact\_mode(), DataFitSurrModel::daceIterator, Model::numFns, Interface::rebuild\_approximation(), Model::surrogateType, and Interface::update\_approximation().

#### **43.20.2.8 void update\_approximation (const Variables & vars, const IntResponsePair & response\_pr, bool rebuild\_flag) [protected, virtual]**

replaces the anchor point, and rebuilds the approximation if requested. This function populates/replaces SurrogateData::anchor{Vars,Resp} and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::{vars,resp}Data) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Interface::rebuild\_approximation(), Model::surrogateType, and Interface::update\_approximation().

#### **43.20.2.9 void update\_approximation (const VariablesArray & *vars\_array*, const IntResponseMap & *resp\_map*, bool *rebuild\_flag*) [protected, virtual]**

replaces the current points array and rebuilds the approximation if requested This function populates/replaces SurrogateData:::{vars,resp}Data and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData:::anchor{Vars,Resp}) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Interface::rebuild\_approximation(), Model::surrogateType, and Interface::update\_approximation().

#### **43.20.2.10 void append\_approximation (bool *rebuild\_flag*) [protected, virtual]**

appends daceIterator results to a global approximation and rebuilds it if requested This function appends one point to SurrogateData:::{vars,resp}Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData:::anchor{Vars,Resp}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References Iterator::all\_responses(), Iterator::all\_samples(), Iterator::all\_variables(), Interface::append\_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Iterator::compact\_mode(), DataFitSurrModel::daceIterator, Model::numFns, Interface::rebuild\_approximation(), and Model::surrogateType.

#### **43.20.2.11 void append\_approximation (const Variables & *vars*, const IntResponsePair & *response\_pr*, bool *rebuild\_flag*) [protected, virtual]**

appends a point to a global approximation and rebuilds it if requested This function appends one point to SurrogateData:::{vars,resp}Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData:::anchor{Vars,Resp}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References Interface::append\_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Interface::rebuild\_approximation(), and Model::surrogateType.

#### **43.20.2.12 void append\_approximation (const VariablesArray & *vars\_array*, const IntResponseMap & *resp\_map*, bool *rebuild\_flag*) [protected, virtual]**

appends an array of points to a global approximation and rebuilds it if requested This function appends multiple points to SurrogateData:::{vars,resp}Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData:::anchor{Vars,Resp}) and does not update the actualModel with revised bounds, labels,

etc. Thus, it appends to data from a previous call to [build\\_approximation\(\)](#), and is not intended to be used in isolation.

Reimplemented from [Model](#).

References      Interface::append\_approximation(),      SurrogateModel::approxBuilds,      DataFitSurrModel::approxInterface, Model::numFns, Interface::rebuild\_approximation(), and Model::surrogateType.

#### **43.20.2.13 void derived\_init\_communicators (const int & max\_iterator\_concurrency, bool recurse\_flag = true) [inline, protected, virtual]**

set up actualModel for parallel operations asynchronous flags need to be initialized for the sub-models. In addition, max\_iterator\_concurrency is the outer level iterator concurrency, not the DACE concurrency that actualModel will see, and recomputing the message\_lengths on the sub-model is probably not a bad idea either. Therefore, recompute everything on actualModel using init\_communicators.

Reimplemented from [Model](#).

References      DataFitSurrModel::actualModel,      DataFitSurrModel::approxInterface,      DataFitSurrModel::daceIterator,      Model::derivative\_concurrency(),      Model::init\_communicators(),      Iterator::is\_null(), Model::is\_null(), Iterator::maximum\_concurrency(), and Interface::minimum\_points().

#### **43.20.2.14 int evaluation\_id () const [inline, protected, virtual]**

return the current evaluation id for the [DataFitSurrModel](#) return the [DataFitSurrModel](#) evaluation count. Due to possibly intermittent use of surrogate bypass, this is not the same as either the approxInterface or actualModel model evaluation counts. It also does not distinguish duplicate evals.

Reimplemented from [Model](#).

References DataFitSurrModel::surrModelEvalCntr.

#### **43.20.2.15 void build\_global () [private]**

Builds a global approximation using daceIterator. Determine points to use in building the approximation and then evaluate them on actualModel using daceIterator. Any changes to the bounds should be performed by setting them at a higher level (e.g., SurrBasedOptStrategy).

References      Dakota::abort\_handler(),      Iterator::active\_set(),      DataFitSurrModel::actualModel,      Iterator::all\_responses(),      Iterator::all\_samples(),      Iterator::all\_variables(),      Interface::append\_approximation(), Interface::approximation\_data(),      DataFitSurrModel::approxInterface,      SurrogateModel::asv\_mapping(), Iterator::compact\_mode(),      DataFitSurrModel::component\_parallel\_mode(),      Variables::continuous\_variables(), Model::currentVariables,      Model::cv(),      Variables::cv(),      DataFitSurrModel::daceIterator,      Dakota::data\_pairs, Variables::discrete\_int\_variables(),      Variables::discrete\_real\_variables(),      Model::div(),      Variables::div(), Model::drv(),      Variables::drv(),      DataFitSurrModel::inside(),      Model::interface\_id(),      Iterator::is\_null(), Model::is\_null(),      Interface::minimum\_points(),      Iterator::num\_samples(),      Model::outputLevel,      DataFitSurrModel::pointReuse,      DataFitSurrModel::pointReuseFile,      DataFitSurrModel::pointsManagement, DataFitSurrModel::pointsTotal,      Interface::recommended\_points(),      DataFitSurrModel::reuseFileResponses, DataFitSurrModel::reuseFileVars,      Iterator::run\_iterator(),      Iterator::sampling\_reset(),      and      SurrogateModel::surrogateFnIndices.

### 43.20.3 Member Data Documentation

#### 43.20.3.1 Model actualModel [private]

the truth model which provides evaluations for building the surrogate (optional for global, required for local) actualModel is unrestricted in type; arbitrary nestings are possible.

Referenced by DataFitSurrModel::build\_approximation(), DataFitSurrModel::build\_global(), DataFitSurrModel::build\_local\_multipoint(), DataFitSurrModel::component\_parallel\_mode(), DataFitSurrModel::DataFitSurrModel(), DataFitSurrModel::derived\_asynch\_compute\_response(), DataFitSurrModel::derived\_free\_communicators(), DataFitSurrModel::derived\_init\_serial(), DataFitSurrModel::derived\_init\_communicators(), DataFitSurrModel::derived\_set\_communicators(), DataFitSurrModel::derived\_synchronize(), DataFitSurrModel::derived\_synchronize\_nowait(), DataFitSurrModel::fine\_grained\_evaluation\_counters(), DataFitSurrModel::inactive\_view(), DataFitSurrModel::inside(), DataFitSurrModel::primary\_response\_fn\_weights(), DataFitSurrModel::print\_evaluation\_summary(), DataFitSurrModel::serve(), DataFitSurrModel::stop\_servers(), DataFitSurrModel::surrogate\_response\_mode(), DataFitSurrModel::truth\_model(), DataFitSurrModel::update\_actual\_model(), DataFitSurrModel::update\_from\_actual\_model(), DataFitSurrModel::update\_from\_subordinate\_model(), DataFitSurrModel::update\_global(), and DataFitSurrModel::update\_local\_multipoint().

The documentation for this class was generated from the following files:

- DataFitSurrModel.H
- DataFitSurrModel.C

## 43.21 DataInterface Class Reference

Handle class for interface specification data.

### Public Member Functions

- `DataInterface ()`  
*constructor*
- `DataInterface (const DataInterface &)`  
*copy constructor*
- `~DataInterface ()`  
*destructor*
- `DataInterface & operator= (const DataInterface &)`  
*assignment operator*
- `void write (std::ostream &s) const`  
*write a `DataInterface` object to an `std::ostream`*
- `void read (MPIUnpackBuffer &s)`  
*read a `DataInterface` object from a packed MPI buffer*
- `void write (MPIPackBuffer &s) const`  
*write a `DataInterface` object to a packed MPI buffer*

### Static Public Member Functions

- static `bool id_compare (const DataInterface &di, const std::string &id)`  
*compares the `idInterface` attribute of `DataInterface` objects*

### Private Attributes

- `DataInterfaceRep * dataIfaceRep`  
*pointer to the body (handle-body idiom)*

### Friends

- class **ProblemDescDB**
- class **NIDRProblemDescDB**

- void [run\\_dakota\\_data \(\)](#)  
*library\_mode default data initializer*

### 43.21.1 Detailed Description

Handle class for interface specification data. The [DataInterface](#) class is used to provide a memory management handle for the data in DataInterfaceRep. It is populated by IDRProblemDescDB::interface\_kwhandler() and is queried by the ProblemDescDB::get\_<datatype>() functions. A list of [DataInterface](#) objects is maintained in [ProblemDescDB::dataInterfaceList](#), one for each interface specification in an input file.

The documentation for this class was generated from the following files:

- [DataInterface.H](#)
- [DataInterface.C](#)

## 43.22 DataMethod Class Reference

Handle class for method specification data.

### Public Member Functions

- `DataMethod ()`  
*constructor*
- `DataMethod (const DataMethod &)`  
*copy constructor*
- `~DataMethod ()`  
*destructor*
- `DataMethod & operator= (const DataMethod &)`  
*assignment operator*
- `void write (std::ostream &s) const`  
*write a `DataMethod` object to an `std::ostream`*
- `void read (MPIUnpackBuffer &s)`  
*read a `DataMethod` object from a packed MPI buffer*
- `void write (MPIPackBuffer &s) const`  
*write a `DataMethod` object to a packed MPI buffer*

### Static Public Member Functions

- static `bool id_compare (const DataMethod &dm, const std::string &id)`  
*compares the `idMethod` attribute of `DataMethod` objects*

### Private Attributes

- `DataMethodRep * dataMethodRep`  
*pointer to the body (handle-body idiom)*

### Friends

- class **ProblemDescDB**
- class **NIDRProblemDescDB**

- void [run\\_dakota\\_data \(\)](#)  
*library\_mode default data initializer*

### 43.22.1 Detailed Description

Handle class for method specification data. The [DataMethod](#) class is used to provide a memory management handle for the data in [DataMethodRep](#). It is populated by IDRProblemDescDB::method\_kwhandler() and is queried by the ProblemDescDB::get\_<datatype>() functions. A list of [DataMethod](#) objects is maintained in [ProblemDescDB::dataMethodList](#), one for each method specification in an input file.

The documentation for this class was generated from the following files:

- [DataMethod.H](#)
- [DataMethod.C](#)

## 43.23 DataMethodRep Class Reference

Body class for method specification data.

### Public Attributes

- **String idMethod**  
*string identifier for the method specification data set (from the `id_method` specification in **MethodIndControl**)*
- **String modelPointer**  
*string pointer to the model specification to be used by this method (from the `model_pointer` specification in **MethodIndControl**)*
- **short methodOutput**  
*method verbosity control: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}\_OUTPUT (from the `output` specification in **MethodIndControl**)*
- **int maxIterations**  
*maximum number of iterations allowed for the method (from the `max_iterations` specification in **MethodIndControl**)*
- **int maxFunctionEvaluations**  
*maximum number of function evaluations allowed for the method (from the `max_function_evaluations` specification in **MethodIndControl**)*
- **bool speculativeFlag**  
*flag for use of speculative gradient approaches for maintaining parallel load balance during the line search portion of optimization algorithms (from the `speculative` specification in **MethodIndControl**)*
- **bool methodUseDerivsFlag**  
*flag for usage of derivative data to enhance the computation of surrogate models (PCE/SC expansions, GP models for EGO/EGRA/EGIE) based on the `use_derivatives` specification*
- **Real convergenceTolerance**  
*iteration convergence tolerance for the method (from the `convergence_tolerance` specification in **MethodIndControl**)*
- **Real constraintTolerance**  
*tolerance for controlling the amount of infeasibility that is allowed before an active constraint is considered to be violated (from the `constraint_tolerance` specification in **MethodIndControl**)*
- **bool methodScaling**  
*flag indicating scaling status (from the `scaling` specification in **MethodIndControl**)*
- **size\_t numFinalSolutions**  
*number of final solutions returned from the iterator*

- RealVector [linearIneqConstraintCoeffs](#)  
*coefficient matrix for the linear inequality constraints (from the linear\_inequality\_constraint\_matrix specification in **MethodIndControl**)*
- RealVector [linearIneqLowerBnd](#)s  
*lower bounds for the linear inequality constraints (from the linear\_inequality\_lower\_bounds specification in **MethodIndControl**)*
- RealVector [linearIneqUpperBnd](#)s  
*upper bounds for the linear inequality constraints (from the linear\_inequality\_upper\_bounds specification in **MethodIndControl**)*
- StringArray [linearIneqScaleTypes](#)  
*scaling types for the linear inequality constraints (from the linear\_inequality\_scale\_types specification in **MethodIndControl**)*
- RealVector [linearIneqScales](#)  
*scaling factors for the linear inequality constraints (from the linear\_inequality\_scales specification in **MethodIndControl**)*
- RealVector [linearEqConstraintCoeffs](#)  
*coefficient matrix for the linear equality constraints (from the linear\_equality\_constraint\_matrix specification in **MethodIndControl**)*
- RealVector [linearEqTargets](#)  
*targets for the linear equality constraints (from the linear\_equality\_targets specification in **MethodIndControl**)*
- StringArray [linearEqScaleTypes](#)  
*scaling types for the linear equality constraints (from the linear\_equality\_scale\_types specification in **MethodIndControl**)*
- RealVector [linearEqScales](#)  
*scaling factors for the linear equality constraints (from the linear\_equality\_scales specification in **MethodIndControl**)*
- String [methodName](#)  
*the method selection: one of the optimizer, least squares, nond, dace, or parameter study methods*
- String [subMethodName](#)  
*string identifier for a sub-method within a multi-option method specification (e.g., from sub\_method\_name in SBL/SBG, dace option, or richardson\_extrap option)*
- String [subMethodPointer](#)  
*string pointer for a sub-method specification used by a multi-component method (from the sub\_method\_pointer specification in SBL/SBG)*
- int [surrBasedLocalSoftConvLimit](#)

*number of consecutive iterations with change less than convergenceTolerance required to trigger convergence within the surrogate-based local method (from the soft\_convergence\_limit specification in MethodSBL)*

- bool [surrBasedLocalLayerBypass](#)

*flag to indicate user-specification of a bypass of any/all layerings in evaluating truth response values in SBL.*

- Real [surrBasedLocalTRInitSize](#)

*initial trust region size in the surrogate-based local method (from the initial\_size specification in MethodSBL) note: this is a relative value, e.g., 0.1 = 10% of global bounds distance (upper bound - lower bound) for each variable*

- Real [surrBasedLocalTRMinSize](#)

*minimum trust region size in the surrogate-based local method (from the minimum\_size specification in MethodSBL), if the trust region size falls below this threshold the SBL iterations are terminated (note: if kriging is used with SBL, the min trust region size is set to 1.0e-3 in attempt to avoid ill-conditioned matrixes that arise in kriging over small trust regions)*

- Real [surrBasedLocalTRContractTrigger](#)

*trust region minimum improvement level (ratio of actual to predicted decrease in objective fcn) in the surrogate-based local method (from the contract\_threshold specification in MethodSBL), the trust region shrinks or is rejected if the ratio is below this value ("eta\_1" in the Conn-Gould-Toint trust region book)*

- Real [surrBasedLocalTRExpandTrigger](#)

*trust region sufficient improvement level (ratio of actual to predicted decrease in objective fn) in the surrogate-based local method (from the expand\_threshold specification in MethodSBL), the trust region expands if the ratio is above this value ("eta\_2" in the Conn-Gould-Toint trust region book)*

- Real [surrBasedLocalTRContract](#)

*trust region contraction factor in the surrogate-based local method (from the contraction\_factor specification in MethodSBL)*

- Real [surrBasedLocalTRExpand](#)

*trust region expansion factor in the surrogate-based local method (from the expansion\_factor specification in MethodSBL)*

- short [surrBasedLocalSubProbObj](#)

*SBL approximate subproblem objective: ORIGINAL\_PRIMARY, SINGLE\_OBJECTIVE, LAGRANGIAN\_OBJECTIVE, or AUGMENTED\_LAGRANGIAN\_OBJECTIVE.*

- short [surrBasedLocalSubProbCon](#)

*SBL approximate subproblem constraints: NO\_CONSTRAINTS, LINEARIZED\_CONSTRAINTS, or ORIGINAL\_CONSTRAINTS.*

- short [surrBasedLocalMeritFn](#)

*SBL merit function type: BASIC\_PENALTY, ADAPTIVE\_PENALTY, BASIC\_LAGRANGIAN, or AUGMENTED\_LAGRANGIAN.*

- short [surrBasedLocalAcceptLogic](#)

*SBL iterate acceptance logic: TR\_RATIO or FILTER.*

- short **surrBasedLocalConstrRelax**

*SBL constraint relaxation method: NO\_RELAX or HOMOTOPY.*
- bool **surrBasedGlobalReplacePts**

*user-specified method for adding points to the set upon which the next surrogate is based in the surrogate-based\_global strategy.*
- String **minMaxType**

*the optimization\_type specification in MethodDOTDC*
- String **dlDetails**

*string of options for a dynamically linked solver*
- void \* **dllib**

*handle to dynamically loaded library*
- int **verifyLevel**

*the verify\_level specification in MethodNPSOLDC*
- Real **functionPrecision**

*the function\_precision specification in MethodNPSOLDC*
- Real **lineSearchTolerance**

*the linesearch\_tolerance specification in MethodNPSOLDC*
- Real **absConvTol**

*absolute function convergence tolerance*
- Real **xConvTol**

*x-convergence tolerance*
- Real **singConvTol**

*singular convergence tolerance*
- Real **singRadius**

*radius for singular convergence test*
- Real **falseConvTol**

*false-convergence tolerance*
- Real **initTRRadius**

*initial trust radius*
- int **covarianceType**

*kind of covariance required*

- bool **regressDiag**  
*whether to print the regression diagnostic vector*
- String **searchMethod**  
*the search\_method specification for Newton and nonlinear interior-point methods in MethodOPTPPDC*
- Real **gradientTolerance**  
*the gradient\_tolerance specification in MethodOPTPPDC*
- Real **maxStep**  
*the max\_step specification in MethodOPTPPDC*
- String **meritFn**  
*the merit\_function specification for nonlinear interior-point methods in MethodOPTPPDC*
- String **centralPath**  
*the central\_path specification for nonlinear interior-point methods in MethodOPTPPDC*
- Real **stepLenToBoundary**  
*the steplength\_to\_boundary specification for nonlinear interior-point methods in MethodOPTPPDC*
- Real **centeringParam**  
*the centering\_parameter specification for nonlinear interior-point methods in MethodOPTPPDC*
- int **searchSchemeSize**  
*the search\_scheme\_size specification for PDS methods in MethodOPTPPDC*
- Real **initStepLength**  
*the initStepLength choice for nonlinearly constrained APPS in MethodAPPSDC*
- Real **contractStepLength**  
*the contractStepLength choice for nonlinearly constrained APPS in MethodAPPSDC*
- Real **threshStepLength**  
*the threshStepLength choice for nonlinearly constrained APPS in MethodAPPSDC*
- String **evalSynchronize**  
*the synchronization choice for nonlinearly constrained APPS in MethodAPPSDC*
- String **meritFunction**  
*the meritFunction choice for nonlinearly constrained APPS in MethodAPPSDC*
- Real **constrPenalty**  
*the constrPenalty choice for nonlinearly constrained APPS in MethodAPPSDC*

- Real `smoothFactor`  
*the initial smoothFactor value for nonlinearly constrained APPS in MethodAPPSDC*
- String `evalSynchronization`  
*the synchronization setting for parallel pattern search methods in MethodCOLINYPSPS and MethodAPPS*
- Real `constraintPenalty`  
*the initial constraint\_penalty for COLINY methods in MethodAPPS, MethodCOLINYDIR, MethodCOLINYPSPS, MethodCOLINYSW and MethodCOLINYEA*
- bool `constantPenalty`  
*the constant\_penalty flag for COLINY methods in MethodCOLINYPSPS and MethodCOLINYSW*
- Real `globalBalanceParam`  
*the global\_balance\_parameter for the DIRECT method in MethodCOLINYDIR*
- Real `localBalanceParam`  
*the local\_balance\_parameter for the DIRECT method in MethodCOLINYDIR*
- Real `maxBoxSize`  
*the max\_boxsize\_limit for the DIRECT method in MethodCOLINYDIR*
- Real `minBoxSize`  
*the min\_boxsize\_limit for the DIRECT method in MethodCOLINYDIR and MethodNCSUDC*
- String `boxDivision`  
*the division setting (major\_dimension or all\_dimensions) for the DIRECT method in MethodCOLINYDIR*
- bool `mutationAdaptive`  
*the non\_adaptive specification for the coliny\_ea method in MethodCOLINYEAEA*
- bool `showMiscOptions`  
*the show\_misc\_options specification in MethodCOLINYDC*
- StringArray `miscOptions`  
*the misc\_options specification in MethodCOLINYDC*
- Real `solnTarget`  
*the solution\_target specification in MethodCOLINYDC*
- Real `crossoverRate`  
*the crossover\_rate specification for EA methods in MethodCOLINYEAEA*
- Real `mutationRate`

*the mutation\_rate specification for EA methods in MethodCOLINYEA*

- Real **mutationScale**

*the mutation\_scale specification for EA methods in MethodCOLINYEA*

- Real **mutationMinScale**

*the min\_scale specification for mutation in EA methods in MethodCOLINYEA*

- Real **initDelta**

*the initial\_delta specification for APPS/COBYLA/PS/SW methods in MethodAPPS, MethodCOLINYCOB, MethodCOLINYPS, and MethodCOLINYSW*

- Real **threshDelta**

*the threshold\_delta specification for APPS/COBYLA/PS/SW methods in MethodAPPS, MethodCOLINYCOB, MethodCOLINYPS, and MethodCOLINYSW*

- Real **contractFactor**

*the contraction\_factor specification for APPS/PS/SW methods in MethodAPPS, MethodCOLINYPS, and MethodCOLINYSW*

- int **newSolnsGenerated**

*the new\_solutions\_generated specification for GA/EPSA methods in MethodCOLINYEA*

- int **numberRetained**

*the integer assignment to random, chc, or elitist in the replacement\_type specification for GA/EPSA methods in MethodCOLINYEA*

- bool **expansionFlag**

*the no\_expansion specification for APPS/PS/SW methods in MethodAPPS, MethodCOLINYPS, and MethodCOLINYSW*

- int **expandAfterSuccess**

*the expand\_after\_success specification for PS/SW methods in MethodCOLINYPS and MethodCOLINYSW*

- int **contractAfterFail**

*the contract\_after\_failure specification for the SW method in MethodCOLINYSW*

- int **mutationRange**

*the mutation\_range specification for the pga\_int method in MethodCOLINYEA*

- int **totalPatternSize**

*the total\_pattern\_size specification for PS methods in MethodCOLINYPS*

- bool **randomizeOrderFlag**

*the stochastic specification for the PS method in MethodCOLINYPS*

- String **selectionPressure**

*the fitness\_type specification for EA methods in MethodCOLINYEA*

- **String replacementType**

*the replacement\_type specification for EA methods in MethodCOLINYEA*

- **String crossoverType**

*the crossover\_type specification for EA methods in MethodCOLINYEA*

- **String mutationType**

*the mutation\_type specification for EA methods in MethodCOLINYEA*

- **String exploratoryMoves**

*the exploratory\_moves specification for the PS method in MethodCOLINYPSPS*

- **String patternBasis**

*the pattern\_basis specification for APPS/PS methods in MethodAPPS and MethodCOLINYPSPS*

- **size\_t numCrossPoints**

*The number of crossover points or multi-point schemes.*

- **size\_t numParents**

*The number of parents to use in a crossover operation.*

- **size\_t numOffspring**

*The number of children to produce in a crossover operation.*

- **String fitnessType**

*the fitness assessment operator to use.*

- **String convergenceType**

*The means by which this JEGA should converge.*

- **Real percentChange**

*The minimum percent change before convergence for a fitness tracker converger.*

- **size\_t numGenerations**

*The number of generations over which a fitness tracker converger should track.*

- **Real fitnessLimit**

*The cutoff value for survival in fitness limiting selectors (e.g., below\_limit selector).*

- **Real shrinkagePercent**

*The minimum percentage of the requested number of selections that must take place on each call to the selector (0, 1).*

- **String nichingType**

---

DAKOTA Version 5.2 Developers Manual generated on November 30, 2011

*The niching type.*

- RealVector [nicheVector](#)

*The discretization percentage along each objective.*

- String [postProcessorType](#)

*The post processor type.*

- RealVector [distanceVector](#)

*The discretization percentage along each objective.*

- String [initializationType](#)

*The means by which the JEGA should initialize the population.*

- String [flatFile](#)

*The filename to use for initialization.*

- String [logFile](#)

*The filename to use for logging.*

- int [populationSize](#)

*the population\_size specification for GA methods in MethodCOLINYEA*

- bool [printPopFlag](#)

*The print\_each\_pop flag to set the printing of the population at each generation.*

- Real [volBoxSize](#)

*the volume\_boxsize\_limit for the DIRECT method in MethodNCSUDC*

- int [numSymbols](#)

*the symbols specification for DACE methods*

- bool [mainEffectsFlag](#)

*the main\_effects specification for sampling methods in MethodDDACE)*

- bool [latinizeFlag](#)

*the latinize specification for FSU QMC and CVT methods in MethodFSUDACE*

- bool [volQualityFlag](#)

*the quality\_metrics specification for sampling methods (FSU QMC and CVT methods in MethodFSUDACE)*

- IntVector [sequenceStart](#)

*the sequenceStart specification in MethodFSUDACE*

- IntVector [sequenceLeap](#)

*the sequenceLeap specification in MethodFSUDACE*

- IntVector **primeBase**  
*the primeBase specification in MethodFSUDACE*
- int **numTrials**  
*the numTrials specification in MethodFSUDACE*
- String **trialType**  
*the trial\_type specification in MethodFSUDACE*
- int **randomSeed**  
*the seed specification for COLINY, NonD, & DACE methods*
- int **numSamples**  
*the samples specification for NonD & DACE methods*
- bool **fixedSeedFlag**  
*flag for fixing the value of the seed among different NonD/DACE sample sets. This results in the use of the same sampling stencil/pattern throughout a strategy with repeated sampling.*
- bool **fixedSequenceFlag**  
*flag for fixing the sequence for Halton or Hammersley QMC sample sets. This results in the use of the same sampling stencil/pattern throughout a strategy with repeated sampling.*
- int **previousSamples**  
*the number of previous samples when augmenting a LHS sample*
- bool **vbdFlag**  
*the var\_based\_decomp specification for a variety of sampling methods*
- Real **vbdDropTolerance**  
*the var\_based\_decomp tolerance for omitting index output*
- short **vbdControl**  
*a sub-specification of vbdFlag: {NO,UNIVARIATE,ALL}\_VBD. When vbdFlag is on, controls granularity of calculation/output of main/interaction/total effects*
- String **rngName**  
*the basic random-number generator for NonD*
- short **refinementType**  
*refinement type for stochastic expansions from dimension refinement keyword group*
- short **refinementControl**  
*refinement control for stochastic expansions from dimension refinement keyword group*

- short [nestingOverride](#)

*override for default point nesting policy: NO\_NESTING\_OVERRIDE, NESTED, or NON\_NESTED*
- short [growthOverride](#)

*override for default point growth restriction policy: NO\_GROWTH\_OVERRIDE, RESTRICTED, or UNRESTRICTED*
- short [expansionType](#)

*enumeration for u-space type that defines u-space variable targets for probability space transformations: EXTENDED\_U (default), ASKEY\_U, STD\_NORMAL\_U, or STD\_UNIFORM\_U*
- bool [piecewiseBasis](#)

*boolean indicating presence of piecewise keyword*
- short [piecewiseBasisType](#)

*enumeration for type of basis in piecewise interpolants: NODAL\_INTERPOLANT or HIERARCHICAL\_INTERPOLANT*
- int [expansionTerms](#)

*the expansion\_terms specification in MethodNonDPCE*
- USHORTArray [expansionOrder](#)

*the expansion\_order specification in MethodNonDPCE*
- int [expansionSamples](#)

*the expansion\_samples specification in MethodNonDPCE*
- String [expansionSampleType](#)

*allows for incremental PCE construction using the incremental\_lhs specification in MethodNonDPCE*
- USHORTArray [quadratureOrder](#)

*the quadrature\_order specification in MethodNonDPCE and MethodNonDSC*
- USHORTArray [sparseGridLevel](#)

*the sparse\_grid\_level specification in MethodNonDPCE, MethodNonDSC, and other stochastic expansion-enabled methods*
- RealVector [anisoGridDimPref](#)

*the dimension\_preference specification for tensor and sparse grids in MethodNonDPCE and MethodNonDSC*
- unsigned short [cubIntOrder](#)

*the cubature\_integrand specification in MethodNonDPCE*
- int [collocationPoints](#)

*the collocation\_points specification in MethodNonDPCE*

- Real [collocationRatio](#)  
*the collocation\_ratio specification in **MethodNonDPCE***
- Real [collocRatioTermsOrder](#)  
*order applied to the number of expansion terms when applying or computing the collocation ratio within regression PCE; based on the ratio\_order specification in **MethodNonDPCE***
- String [collocPtReuse](#)  
*allows for incremental PCE construction using the reuse\_points specification in **MethodNonDPCE***
- bool [probCollocFlag](#)  
*flag for usage of a filtered set of tensor-product grid points within regression PCE; based on the tensor\_grid specification in **MethodNonDPCE***
- String [expansionImportFile](#)  
*the expansion\_import\_file specification in **MethodNonDPCE***
- String [sampleType](#)  
*the sample\_type specification in **MethodNonDMC**, **MethodNonDPCE**, and **MethodNonDSC***
- String [reliabilitySearchType](#)  
*the type of limit state search in **MethodNonDLocalRel** (`x_taylor_mean`, `x_taylor_mpp`, `x_two_point`, `u_taylor_mean`, `u_taylor_mpp`, `u_two_point`, or `no_approx`) or **MethodNonDGlobalRel** (`x_gaussian_process` or `u_gaussian_process`)*
- String [reliabilityIntegration](#)  
*the first\_order or second\_order integration selection in **MethodNonDLocalRel***
- String [integrationRefine](#)  
*the import, adapt\_import, or mm\_adapt\_import integration refinement selection in **MethodNonDLocalRel**, **MethodNonDPCE**, and **MethodNonDSC***
- String [nondOptAlgorithm](#)  
*the algorithm selection `sqp` or `nip` used for computing the MPP in **MethodNonDLocalRel** or the interval in **MethodNonDLocalIntervalEst***
- String [distributionType](#)  
*the distribution cumulative or complementary specification in **MethodNonDMC**, **MethodNonDPCE**, **MethodNonDLocalRel**, and **MethodNonDGlobalRel***
- String [responseLevelMappingType](#)  
*the compute probabilities, reliabilities, or gen\_reliabilities specification in **MethodNonDMC**, **MethodNonDPCE**, **MethodNonDLocalRel**, and **MethodNonDGlobalRel***
- RealVectorArray [responseLevels](#)  
*the response\_levels specification in **MethodNonDMC**, **MethodNonDPCE**, **MethodNonDLocalRel**, and **MethodNonDGlobalRel***

- RealVectorArray [probabilityLevels](#)  
*the probability\_levels specification in MethodNonDMC, MethodNonDPCE, MethodNonDLocalRel, and MethodNonDGlobalRel*
- RealVectorArray [reliabilityLevels](#)  
*the reliability\_levels specification in MethodNonDMC, MethodNonDPCE, and MethodNonDLocalRel*
- RealVectorArray [genReliabilityLevels](#)  
*the gen\_reliability\_levels specification in MethodNonDMC, MethodNonDPCE, MethodNonDLocalRel, and MethodNonDGlobalRel*
- bool [allVarsFlag](#)  
*the all\_variables specification in MethodNonDMC*
- int [emulatorSamples](#)  
*the number of samples to construct a GP emulator for Bayesian calibration methods (MethodNonDBayesCalib)*
- short [emulatorType](#)  
*the emulator specification in MethodNonDBayesCalib*
- String [rejectionType](#)  
*the rejection type specification in MethodNonDBayesCalib*
- String [metropolisType](#)  
*the metropolis type specification in MethodNonDBayesCalib*
- Real [proposalCovScale](#)  
*the proposal covariance scale factor in MethodNonDBayesCalib*
- Real [likelihoodScale](#)  
*the likelihood scale factor in MethodNonDBayesCalib*
- RealVector [finalPoint](#)  
*the final\_point specification in MethodPSVPS*
- RealVector [stepVector](#)  
*the step\_vector specification in MethodPSVPS and MethodPSCPS*
- int [numSteps](#)  
*the num\_steps specification in MethodPSVPS*
- IntVector [stepsPerVariable](#)  
*the deltas\_per\_variable specification in MethodPSCPS*

- RealVector [listOfPoints](#)  
*the list\_of\_points specification in **MethodPSLPS***
- USHORTArray [varPartitions](#)  
*the partitions specification for PStudy method in **MethodPSMPS***
- Real [refinementRate](#)  
*rate of mesh refinement in Richardson extrapolation*

## Private Attributes

- int [referenceCount](#)  
*number of handle objects sharing this dataMethodRep*

## Friends

- class [DataMethod](#)  
*the handle class can access attributes of the body class directly*

### 43.23.1 Detailed Description

Body class for method specification data. The [DataMethodRep](#) class is used to contain the data from a method keyword specification. Default values are managed in the [DataMethodRep](#) constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within [ProblemDescDB](#) since [ProblemDescDB::dataMethodList](#) is private.

The documentation for this class was generated from the following files:

- [DataMethod.H](#)
- [DataMethod.C](#)

## 43.24 DataModel Class Reference

Handle class for model specification data.

### Public Member Functions

- `DataModel ()`  
*constructor*
- `DataModel (const DataModel &)`  
*copy constructor*
- `~DataModel ()`  
*destructor*
- `DataModel & operator= (const DataModel &)`  
*assignment operator*
- `void write (std::ostream &s) const`  
*write a `DataModel` object to an `std::ostream`*
- `void read (MPIUnpackBuffer &s)`  
*read a `DataModel` object from a packed MPI buffer*
- `void write (MPIPackBuffer &s) const`  
*write a `DataModel` object to a packed MPI buffer*

### Static Public Member Functions

- `static bool id_compare (const DataModel &dm, const std::string &id)`  
*compares the `idModel` attribute of `DataModel` objects*

### Private Attributes

- `DataModelRep * dataModelRep`  
*pointer to the body (handle-body idiom)*

### Friends

### 43.24.1 Detailed Description

Handle class for model specification data. The [DataModel](#) class is used to provide a memory management handle for the data in [DataModelRep](#). It is populated by IDRProblemDescDB::model\_kwhandler() and is queried by the ProblemDescDB::get\_<datatype>() functions. A list of [DataModel](#) objects is maintained in [ProblemDescDB::dataModelList](#), one for each model specification in an input file.

The documentation for this class was generated from the following files:

- [DataModel.H](#)
- [DataModel.C](#)

## 43.25 DataModelRep Class Reference

Body class for model specification data.

### Public Attributes

- **String idModel**  
*string identifier for the model specification data set (from the `id_model` specification in **ModelIndControl**)*
- **String modelType**  
*model type selection: single, surrogate, or nested (from the model type specification in **ModelIndControl**)*
- **String variablesPointer**  
*string pointer to the variables specification to be used by this model (from the `variables_pointer` specification in **ModelIndControl**)*
- **String interfacePointer**  
*string pointer to the interface specification to be used by this model (from the `interface_pointer` specification in **ModelSingle** and the `optional_interface_pointer` specification in **ModelNested**)*
- **String responsesPointer**  
*string pointer to the responses specification to be used by this model (from the `responses_pointer` specification in **ModelIndControl**)*
- **String subMethodPointer**  
*pointer to a sub-iterator used for global approximations (from the `dace_method_pointer` specification in **ModelSurrG**) or by nested models (from the `sub_method_pointer` specification in **ModelNested**)*
- **IntSet surrogateFnIndices**  
*array specifying the response function set that is approximated*
- **String surrogateType**  
*the selected surrogate type: local\_taylor, multipoint\_tana, global\_(neural\_network,mars,orthogonal\_polynomial,gaussian, polynomial,kriging), or hierarchical*
- **String truthModelPointer**  
*pointer to the model specification for constructing the truth model used in building local, multipoint, and hierarchical approximations (from the `actual_model_pointer` specification in **ModelSurrL** and **ModelSurrMP** and the `high_fidelity_model_pointer` specification in **ModelSurrH**)*
- **String lowFidelityModelPointer**  
*pointer to the low fidelity model specification used in hierarchical approximations (from the `low_fidelity_model_pointer` specification in **ModelSurrH**)*
- **int pointsTotal**  
*user-specified lower bound on total points with which to build the model (if `reuse_points < pointsTotal`, new samples will make up the difference)*

- short `pointsManagement`

*points management configuration for `DataFitSurrModel`: `DEFAULT_POINTS`, `MINIMUM_POINTS`, or `RECOMMENDED_POINTS`*

- String `approxPointReuse`

*sample reuse selection for building global approximations: `none`, `all`, `region`, or `file` (from the `reuse_samples` specification in `ModelSurrG`)*

- String `approxPointReuseFile`

*the file name for the "file" setting for the `reuse_samples` specification in `ModelSurrG`*

- bool `approxPointFileAnnotated`

*whether the point reuse file is annotated (default true)*

- short `approxCorrectionType`

*correction type for global and hierarchical approximations: `NO_CORRECTION`, `ADDITIVE_CORRECTION`, `MULTIPLICATIVE_CORRECTION`, or `COMBINED_CORRECTION` (from the `correction` specification in `ModelSurrG` and `ModelSurrH`)*

- short `approxCorrectionOrder`

*correction order for global and hierarchical approximations: 0, 1, or 2 (from the `correction` specification in `ModelSurrG` and `ModelSurrH`)*

- bool `modelUseDerivsFlag`

*flags the use of derivatives in building global approximations (from the `use_derivatives` specification in `ModelSurrG`)*

- short `polynomialOrder`

*scalar integer indicating the order of the polynomial approximation (1=linear, 2=quadratic, 3=cubic; from the `polynomial` specification in `ModelSurrG`)*

- RealVector `krigingCorrelations`

*vector of correlations used in building a kriging approximation (from the `correlations` specification in `ModelSurrG`)*

- String `krigingOptMethod`

*optimization method to use in finding optimal correlation parameters: `none`, `sampling`, `local`, `global`*

- short `krigingMaxTrials`

*maximum number of trials in optimization of kriging correlations*

- RealVector `krigingMaxCorrelations`

*upper bound on kriging correlation vector*

- RealVector `krigingMinCorrelations`

*lower bound on kriging correlation vector*

- short **mlsPolyOrder**  
*polynomial order for moving least squares approximation*
- short **mlsWeightFunction**  
*weight function for moving least squares approximation*
- short **rbfBases**  
*bases for radial basis function approximation*
- short **rbfMaxPts**  
*maximum number of points for radial basis function approximation*
- short **rbfMaxSubsets**  
*maximum number of subsets for radial basis function approximation*
- short **rbfMinPartition**  
*minimum partition for radial basis function approximation*
- short **marsMaxBases**  
*maximum number of bases for MARS approximation*
- String **marsInterpolation**  
*interpolation type for MARS approximation*
- short **annRandomWeight**  
*random weight for artificial neural network approximation*
- short **annNodes**  
*number of nodes for artificial neural network approximation*
- Real **annRange**  
*range for artificial neural network approximation*
- String **trendOrder**  
*scalar integer indicating the order of the Gaussian process mean (0= constant, 1=linear, 2=quadratic, 3=cubic); from the gaussian\_process specification in ModelSurrG)*
- bool **pointSelection**  
*flag indicating the use of point selection in the Gaussian process*
- StringArray **diagMetrics**  
*List of diagnostic metrics the user requests to assess the goodness of fit for a surrogate model.*
- String **optionalInterfRespPointer**

*string pointer to the responses specification used by the optional interface in nested models (from the optional\_interface\_responses\_pointer specification in ModelNested)*

- **StringArray primaryVarMaps**

*the primary variable mappings used in nested models for identifying the lower level variable targets for inserting top level variable values (from the primary\_variable\_mapping specification in ModelNested)*

- **StringArray secondaryVarMaps**

*the secondary variable mappings used in nested models for identifying the (distribution) parameter targets within the lower level variables for inserting top level variable values (from the secondary\_variable\_mapping specification in ModelNested)*

- **RealVector primaryRespCoeffs**

*the primary response mapping matrix used in nested models for weighting contributions from the sub-iterator responses in the top level (objective) functions (from the primary\_response\_mapping specification in ModelNested)*

- **RealVector secondaryRespCoeffs**

*the secondary response mapping matrix used in nested models for weighting contributions from the sub-iterator responses in the top level (constraint) functions (from the secondary\_response\_mapping specification in ModelNested)*

## Private Member Functions

- **DataModelRep ()**

*constructor*

- **~DataModelRep ()**

*destructor*

- **void write (std::ostream &s) const**

*write a DataModelRep object to an std::ostream*

- **void read (MPIUnpackBuffer &s)**

*read a DataModelRep object from a packed MPI buffer*

- **void write (MPIPackBuffer &s) const**

*write a DataModelRep object to a packed MPI buffer*

## Private Attributes

- **int referenceCount**

*number of handle objects sharing this dataModelRep*

## Friends

- class [DataModel](#)  
*the handle class can access attributes of the body class directly*

### 43.25.1 Detailed Description

Body class for model specification data. The [DataModelRep](#) class is used to contain the data from a model keyword specification. Default values are managed in the [DataModelRep](#) constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within [ProblemDescDB](#) since [ProblemDescDB::dataModelList](#) is private.

The documentation for this class was generated from the following files:

- DataModel.H
- DataModel.C

## 43.26 DataResponses Class Reference

Handle class for responses specification data.

### Public Member Functions

- `DataResponses ()`  
*constructor*
- `DataResponses (const DataResponses &)`  
*copy constructor*
- `~DataResponses ()`  
*destructor*
- `DataResponses & operator= (const DataResponses &)`  
*assignment operator*
- `void write (std::ostream &s) const`  
*write a `DataResponses` object to an `std::ostream`*
- `void read (MPIUnpackBuffer &s)`  
*read a `DataResponses` object from a packed MPI buffer*
- `void write (MPIPackBuffer &s) const`  
*write a `DataResponses` object to a packed MPI buffer*

### Static Public Member Functions

- `static bool id_compare (const DataResponses &dr, const std::string &id)`  
*compares the `idResponses` attribute of `DataResponses` objects*

### Private Attributes

- `DataResponsesRep * dataRespRep`  
*pointer to the body (handle-body idiom)*

### Friends

- class **ProblemDescDB**
- class **NIDRProblemDescDB**

## 43.27 DataResponsesRep Class Reference

Body class for responses specification data.

### Public Attributes

- `size_t numObjectiveFunctions`  
*number of objective functions (from the num\_objective\_functions specification in **RespFnOpt**)*
- `size_t numNonlinearIneqConstraints`  
*number of nonlinear inequality constraints (from the num\_nonlinear\_inequality\_constraints specification in **RespFnOpt**)*
- `size_t numNonlinearEqConstraints`  
*number of nonlinear equality constraints (from the num\_nonlinear\_equality\_constraints specification in **RespFnOpt**)*
- `size_t numLeastSqTerms`  
*number of least squares terms (from the num\_least\_squares\_terms specification in **RespFnLS**)*
- `size_t numResponseFunctions`  
*number of generic response functions (from the num\_response\_functions specification in **RespFnGen**)*
- `StringArray primaryRespFnScaleTypes`  
*vector of primary response function scaling types (from the objective\_function\_scale\_types specification in **RespFnOpt** and the least\_squares\_term\_scale\_types specification in **RespFnLS**)*
- `RealVector primaryRespFnScales`  
*vector of primary response function scaling factors (from the objective\_function\_scales specification in **RespFnOpt** and the least\_squares\_term\_scales specification in **RespFnLS**)*
- `RealVector primaryRespFnWeights`  
*vector of weightings for multiobjective optimization or weighted nonlinear least squares (from the multi-objective\_weights specification in **RespFnOpt** and the least\_squares\_weights specification in **RespFnLS**)*
- `RealVector expConfigVars`  
*list of num\_experiments x num\_config\_vars configuration variable values*
- `RealVector expObservations`  
*list of num\_calibration\_terms observation data*
- `RealVector expStdDeviations`  
*list of 1 or num\_calibration\_terms observation standard deviations*
- `String expDataFileName`

*name of experimental data file containing response data (with optional state variable and sigma data) to read*

- bool **expDataFileAnnotated**  
*whether the experimental data is in annotated format*
- size\_t **numExperiments**  
*number of rows of experimental data (replicates or distinct experiments)*
- size\_t **numExpConfigVars**  
*number of experimental configuration vars (state variables) in each row of data*
- size\_t **numExpStdDeviations**  
*whether to read num\_responses standard deviations from each row of data file*
- RealVector **nonlinearIneqLowerBnds**  
*vector of nonlinear inequality constraint lower bounds (from the nonlinear\_inequality\_lower\_bounds specification in **RespFnOpt**)*
- RealVector **nonlinearIneqUpperBnds**  
*vector of nonlinear inequality constraint upper bounds (from the nonlinear\_inequality\_upper\_bounds specification in **RespFnOpt**)*
- StringArray **nonlinearIneqScaleTypes**  
*vector of nonlinear inequality constraint scaling types (from the nonlinear\_inequality\_scale\_types specification in **RespFnOpt**)*
- RealVector **nonlinearIneqScales**  
*vector of nonlinear inequality constraint scaling factors (from the nonlinear\_inequality\_scales specification in **RespFnOpt**)*
- RealVector **nonlinearEqTargets**  
*vector of nonlinear equality constraint targets (from the nonlinear\_equality\_targets specification in **RespFnOpt**)*
- StringArray **nonlinearEqScaleTypes**  
*vector of nonlinear equality constraint scaling types (from the nonlinear\_equality\_scale\_types specification in **RespFnOpt**)*
- RealVector **nonlinearEqScales**  
*vector of nonlinear equality constraint scaling factors (from the nonlinear\_equality\_scales specification in **RespFnOpt**)*
- String **gradientType**  
*gradient type: none, numerical, analytic, or mixed (from the no\_gradients, numerical\_gradients, analytic\_gradients, and mixed\_gradients specifications in **RespGrad**)*
- String **hessianType**

*Hessian type: none, numerical, quasi, analytic, or mixed (from the no\_hessians, numerical\_hessians, quasi\_hessians, analytic\_hessians, and mixed\_hessians specifications in **RespHess**).*

- bool [ignoreBounds](#)  
*option to ignore bounds when doing finite differences (default is to honor bounds)*
- bool [centralHess](#)  
*Temporary(?) option to use old 2nd-order diffs when computing finite-difference Hessians; default is forward differences.*
- String [quasiHessianType](#)  
*quasi-Hessian type: bfgs, damped\_bfgs, or sr1 (from the bfgs and sr1 specifications in **RespHess**)*
- String [methodSource](#)  
*numerical gradient method source: dakota or vendor (from the method\_source specification in **RespGradNum** and **RespGradMixed**)*
- String [intervalType](#)  
*numerical gradient interval type: forward or central (from the interval\_type specification in **RespGradNum** and **RespGradMixed**)*
- RealVector [fdGradStepSize](#)  
*vector of finite difference step sizes for numerical gradients, one step size per active continuous variable, used in computing 1st-order forward or central differences (from the fd\_gradient\_step\_size specification in **RespGradNum** and **RespGradMixed**)*
- RealVector [fdHessStepSize](#)  
*vector of finite difference step sizes for numerical Hessians, one step size per active continuous variable, used in computing 1st-order gradient-based differences and 2nd-order function-based differences (from the fd\_hessian\_step\_size specification in **RespHessNum** and **RespHessMixed**)*
- IntList [idNumericalGrads](#)  
*mixed gradient numerical identifiers (from the id\_numerical\_gradients specification in **RespGradMixed**)*
- IntList [idAnalyticGrads](#)  
*mixed gradient analytic identifiers (from the id\_analytic\_gradients specification in **RespGradMixed**)*
- IntList [idNumericalHessians](#)  
*mixed Hessian numerical identifiers (from the id\_numerical\_hessians specification in **RespHessMixed**)*
- IntList [idQuasiHessians](#)  
*mixed Hessian quasi identifiers (from the id\_quasi\_hessians specification in **RespHessMixed**)*
- IntList [idAnalyticHessians](#)  
*mixed Hessian analytic identifiers (from the id\_analytic\_hessians specification in **RespHessMixed**)*
- String [idResponses](#)

*string identifier for the responses specification data set (from the `id_responses` specification in **RespSetId**)*

- `StringArray responseLabels`  
*the response labels array (from the `response_descriptors` specification in **RespLabels**)*

## Private Member Functions

- `DataResponsesRep ()`  
*constructor*

### 43.28.1 Detailed Description

Handle class for strategy specification data. The [DataStrategy](#) class is used to provide a memory management handle for the data in [DataStrategyRep](#). It is populated by IDRProblemDescDB::strategy\_kwhandler() and is queried by the ProblemDescDB::get\_<datatype>() functions. A single [DataStrategy](#) object is maintained in ProblemDescDB::strategySpec.

The documentation for this class was generated from the following files:

- DataStrategy.H
- DataStrategy.C

## 43.29 DataStrategyRep Class Reference

Body class for strategy specification data.

### Public Attributes

- **String strategyType**  
*the strategy selection: hybrid, multi\_start, pareto\_set, or single\_method*
- **bool graphicsFlag**  
*flags use of graphics by the strategy (from the graphics specification in StratIndControl)*
- **bool tabularDataFlag**  
*flags tabular data collection by the strategy (from the tabular\_graphics\_data specification in StratIndControl)*
- **String tabularDataFile**  
*the filename used for tabular data collection by the strategy (from the tabular\_graphics\_file specification in StratIndControl)*
- **int outputPrecision**  
*output precision for tabular and screen output*
- **int iteratorServers**  
*number of servers for concurrent iterator parallelism (from the iterator\_servers specification in StratIndControl)*
- **String iteratorScheduling**  
*type of scheduling (self or static) used in concurrent iterator parallelism (from the iterator\_self\_scheduling and iterator\_static\_scheduling specifications in StratIndControl)*
- **String methodPointer**  
*method identifier for the strategy (from the opt\_method\_pointer specifications in StratParetoSet and method\_pointer specifications in StratSingle and StratMultiStart)*
- **StringArray hybridMethodList**  
*array of methods for the sequential and collaborative hybrid optimization strategies (from the method\_list specification in StratHybrid)*
- **String hybridType**  
*the type of hybrid optimization strategy: collaborative, embedded, sequential, or sequential\_adaptive (from the collaborative, embedded, and sequential specifications in StratHybrid)*
- **String hybridGlobalMethodPointer**  
*global method pointer for embedded hybrids (from the global\_method\_pointer specification in StratHybrid)*
- **String hybridLocalMethodPointer**

*local method pointer for embedded hybrids (from the local\_method\_pointer specification in StratHybrid)*

- Real [hybridLSProb](#)

*local search probability for embedded hybrids (from the local\_search\_probability specification in StratHybrid)*

- int [concurrentRandomJobs](#)

*number of random jobs to perform in the concurrent strategy (from the random\_starts and random\_weight\_sets specifications in StratMultiStart and StratParetoSet)*

- int [concurrentSeed](#)

*seed for the selected random jobs within the concurrent strategy (from the seed specification in StratMultiStart and StratParetoSet)*

- RealVector [concurrentParameterSets](#)

*user-specified (i.e., nonrandom) parameter sets to evaluate in the concurrent strategy (from the starting\_points and multi\_objective\_weight\_sets specifications in StratMultiStart and StratParetoSet)*

## Private Member Functions

- `DataVariables.C`

## 43.31 DataVariablesRep Class Reference

Body class for variables specification data.

### Public Attributes

- **String idVariables**  
*string identifier for the variables specification data set (from the id\_variables specification in VarSetId)*
- **size\_t numContinuousDesVars**  
*number of continuous design variables (from the continuous\_design specification in VarDV)*
- **size\_t numDiscreteDesRangeVars**  
*number of discrete design variables defined by an integer range (from the discrete\_design\_range specification in VarDV)*
- **size\_t numDiscreteDesSetIntVars**  
*number of discrete design variables defined by a set of integers (from the discrete\_design\_set\_integer specification in VarDV)*
- **size\_t numDiscreteDesSetRealVars**  
*number of discrete design variables defined by a set of reals (from the discrete\_design\_set\_real specification in VarDV)*
- **size\_t numNormalUncVars**  
*number of normal uncertain variables (from the normal\_uncertain specification in VarAUV)*
- **size\_t numLognormalUncVars**  
*number of lognormal uncertain variables (from the lognormal\_uncertain specification in VarAUV)*
- **size\_t numUniformUncVars**  
*number of uniform uncertain variables (from the uniform\_uncertain specification in VarAUV)*
- **size\_t numLoguniformUncVars**  
*number of loguniform uncertain variables (from the loguniform\_uncertain specification in VarAUV)*
- **size\_t numTriangularUncVars**  
*number of triangular uncertain variables (from the triangular\_uncertain specification in VarAUV)*
- **size\_t numExponentialUncVars**  
*number of exponential uncertain variables (from the exponential\_uncertain specification in VarAUV)*
- **size\_t numBetaUncVars**  
*number of beta uncertain variables (from the beta\_uncertain specification in VarAUV)*
- **size\_t numGammaUncVars**

*number of gamma uncertain variables (from the gamma\_uncertain specification in VarAUV)*

- size\_t **numGumbelUncVars**

*number of gumbel uncertain variables (from the gumbel\_uncertain specification in VarAUV)*

- size\_t **numFrechetUncVars**

*number of frechet uncertain variables (from the frechet\_uncertain specification in VarAUV)*

- size\_t **numWeibullUncVars**

*number of weibull uncertain variables (from the weibull\_uncertain specification in VarAUV)*

- size\_t **numHistogramBinUncVars**

*number of histogram bin uncertain variables (from the histogram\_bin\_uncertain specification in VarAUV)*

- size\_t **numPoissonUncVars**

*number of Poisson uncertain variables (from the poisson\_uncertain specification in VarAUV)*

- size\_t **numBinomialUncVars**

*number of binomial uncertain variables (from the binomial\_uncertain specification in VarAUV)*

- size\_t **numNegBinomialUncVars**

*number of negative binomial uncertain variables (from the negative\_binomial\_uncertain specification in VarAUV)*

- size\_t **numGeometricUncVars**

*number of geometric uncertain variables (from the geometric\_uncertain specification in VarAUV)*

- size\_t **numHyperGeomUncVars**

*number of hypergeometric uncertain variables (from the hypergeometric\_uncertain specification in VarAUV))*

- size\_t **numHistogramPtUncVars**

*number of histogram point uncertain variables (from the histogram\_point\_uncertain specification in VarAUV)*

- size\_t **numIntervalUncVars**

*number of interval uncertain variables (from the interval\_uncertain specification in VarEUV)*

- size\_t **numContinuousStateVars**

*number of continuous state variables (from the continuous\_state specification in VarSV)*

- size\_t **numDiscreteStateRangeVars**

*number of discrete state variables defined by an integer range (from the discrete\_state\_range specification in VarDV)*

- size\_t **numDiscreteStateSetIntVars**

*number of discrete state variables defined by a set of integers (from the discrete\_state\_set\_integer specification in VarDV)*

- `size_t numDiscreteStateSetRealVars`

*number of discrete state variables defined by a set of reals (from the discrete\_state\_set\_real specification in VarDV)*

- `RealVector continuousDesignVars`

*initial values for the continuous design variables array (from the continuous\_design initial\_point specification in VarDV)*

- `RealVector continuousDesignLowerBnds`

*lower bounds array for the continuous design variables (from the continuous\_design lower\_bounds specification in VarDV)*

- `RealVector continuousDesignUpperBnds`

*upper bounds array for the continuous design variables (from the continuous\_design upper\_bounds specification in VarDV)*

- `StringArray continuousDesignScaleTypes`

*scale types array for the continuous design variables (from the continuous\_design scale\_types specification in VarDV)*

- `RealVector continuousDesignScales`

*scales array for the continuous design variables (from the continuous\_design scales specification in VarDV)*

- `IntVector discreteDesignRangeVars`

*initial values for the discrete design variables defined by an integer range (from the discrete\_design\_range initial\_point specification in VarDV)*

- `IntVector discreteDesignRangeLowerBnds`

*lower bounds array for the discrete design variables defined by an integer range (from the discrete\_design\_range lower\_bounds specification in VarDV)*

- `IntVector discreteDesignRangeUpperBnds`

*upper bounds array for the discrete design variables defined by an integer range (from the discrete\_design\_range upper\_bounds specification in VarDV)*

- `IntVector discreteDesignSetIntVars`

*initial values for the discrete design variables defined by an integer set (from the discrete\_design\_set\_integer initial\_point specification in VarDV)*

- `RealVector discreteDesignSetRealVars`

*initial values for the discrete design variables defined by a real set (from the discrete\_design\_set\_real initial\_point specification in VarDV)*

- `IntSetArray discreteDesignSetInt`

*complete set of admissible values for each of the discrete design variables defined by an integer set (from the discrete\_design\_set\_integer set\_values specification in **VarDV**)*

- RealSetArray [discreteDesignSetReal](#)

## Friends

- class [DataVariables](#)  
*the handle class can access attributes of the body class directly*

### 43.31.1 Detailed Description

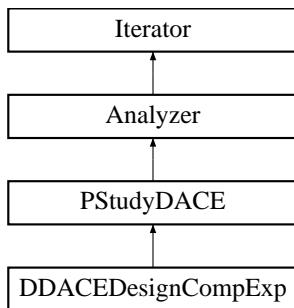

Body class for variables specification data. The [DataVariablesRep](#) class is used to contain the data from a variables keyword specification. Default values are managed in the [DataVariablesRep](#) constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within [ProblemDescDB](#) since [ProblemDescDB::dataVariablesList](#) is private.

The documentation for this class was generated from the following files:

- DataVariables.H
- DataVariables.C

## 43.32 DDACEDesignCompExp Class Reference

Wrapper class for the DDACE design of experiments library. Inheritance diagram for DDACEDesignCompExp::

### Public Member Functions

- **`DDACEDesignCompExp (Model &model)`**  
*primary constructor for building a standard DACE iterator*
- **`DDACEDesignCompExp (Model &model, int samples, int symbols, int seed, const String &sampling_-method)`**  
*alternate constructor used for building approximations*
- **`~DDACEDesignCompExp ()`**  
*destructor*
- **`void pre_run ()`**  
*pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori*
- **`void extract_trends ()`**  
*Redefines the run\_iterator virtual function for the PStudy/DACE branch.*
- **`void post_input ()`**  
*read tabular data for post-run mode*
- **`void post_run (std::ostream &s)`**  
*post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way*
- **`int num_samples () const`**  
*get the current number of samples*
- **`void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)`**  
*reset sampling iterator to use at least min\_samples*

- const `String & sampling_scheme () const`  
*return sampling name*
- void `vary_pattern (bool pattern_flag)`  
*sets varyPattern in derived classes that support it*
- void `get_parameter_sets (Model &model)`  
*Returns one block of samples (ndim \* num\_samples).*

## Private Member Functions

- void `compute_main_effects ()`  
*builds a DDaceMainEffects::OneWayANOVA if mainEffectsFlag is set*
- void `resolve_samples_symbols ()`  
*convenience function for resolving number of samples and number of symbols from input.*

## Static Private Member Functions

- static void `copy_data (const std::vector< DDaceSamplePoint > &dspa, Real *ptr, const int ptr_len)`  
*copy DDACE point to RealVector*

## Private Attributes

- `String daceMethod`  
*oas, lhs, oa\_lhs, random, box\_behnken, central\_composite, or grid*
- `int samplesSpec`  
*initial specification of number of samples*
- `int symbolsSpec`  
*initial specification of number of symbols*
- `int numSamples`  
*current number of samples to be evaluated*
- `int numSymbols`  
*current number of symbols to be used in generating the sample set (inversely related to number of replications)*
- `const int seedSpec`  
*the user seed specification for the random number generator (allows repeatable results)*

- int `randomSeed`  
*current seed for the random number generator*
- bool `allDataFlag`  
*flag which triggers the update of allVars/allResponses for use by `Iterator::all_variables()` and `Iterator::all_responses()`*
- size\_t `numDACERuns`  
*counter for number of `run()` executions for this object*
- bool `varyPattern`  
*flag for continuing the random number sequence from a previous `run()` execution (e.g., for surrogate-based optimization) so that multiple executions are repeatable but not correlated.*
- bool `mainEffectsFlag`  
*flag which specifies main effects*
- std::vector< std::vector< int > > `symbolMapping`  
*mapping of symbols for main effects calculations*

### 43.32.1 Detailed Description

Wrapper class for the DDACE design of experiments library. The `DDACEDesignCompExp` class provides a wrapper for DDACE, a C++ design of experiments library from the Computational Sciences and Mathematics Research (CSMR) department at Sandia's Livermore CA site. This class uses design and analysis of computer experiments (DACE) methods to sample the design space spanned by the bounds of a `Model`. It returns all generated samples and their corresponding responses as well as the best sample found.

### 43.32.2 Constructor & Destructor Documentation

#### 43.32.2.1 `DDACEDesignCompExp (Model & model)`

primary constructor for building a standard DACE iterator This constructor is called for a standard iterator built with data from probDescDB.

References Dakota::abort\_handler(), `DDACEDesignCompExp::daceMethod`, `DDACEDesignCompExp::mainEffectsFlag`, `Iterator::maxConcurrency`, `Iterator::numContinuousVars`, and `DDACEDesignCompExp::numSamples`.

#### 43.32.2.2 `DDACEDesignCompExp (Model & model, int samples, int symbols, int seed, const String & sampling_method)`

alternate constructor used for building approximations This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.

References `Iterator::maxConcurrency`, `DDACEDESIGNCOMPEXP::numSamples`, and `DDACEDESIGNCOMPEXP::resolve_samples_symbols()`.

### 43.32.3 Member Function Documentation

#### 43.32.3.1 void pre\_run () [virtual]

pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all [Variables](#) (parameter sets) a priori pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [pre\\_run\(\)](#), if implemented, typically `_before_` performing its own implementation steps.

Reimplemented from [Iterator](#).

References `DDACEDESIGNCOMPEXP::get_parameter_sets()`, `Iterator::iteratedModel`, and `PStudyDACE::varBasedDecompFlag`.

#### 43.32.3.2 void post\_run (std::ostream & s) [virtual]

post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [post\\_run\(\)](#), typically `_after_` performing its own implementation steps.

Reimplemented from [Iterator](#).

References `Analyzer::allResponses`, `Analyzer::allSamples`, `SensAnalysisGlobal::compute_correlations()`, `DDACEDESIGNCOMPEXP::compute_main_effects()`, `DDACEDESIGNCOMPEXP::mainEffectsFlag`, `PStudyDACE::pStudyDACEsensGlobal`, `Iterator::subIteratorFlag`, and `PStudyDACE::varBasedDecompFlag`.

#### 43.32.3.3 int num\_samples () const [inline, virtual]

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References `DDACEDESIGNCOMPEXP::numSamples`.

#### 43.32.3.4 void resolve\_samples\_symbols () [private]

convenience function for resolving number of samples and number of symbols from input. This function must define a combination of samples and symbols that is acceptable for a particular sampling algorithm. Users provide requests for these quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References `Dakota::abort_handler()`, `DDACEDESIGNCOMPEXP::daceMethod`, `Iterator::numContinuousVars`, `DDACEDESIGNCOMPEXP::numSamples`, and `DDACEDESIGNCOMPEXP::numSymbols`.

Referenced by DDACEDesignCompExp::DDACEDesignCompExp(), and DDACEDesignCompExp::get\_parameter\_sets().

**43.32.3.5 void copy\_data (const std::vector< DDaceSamplePoint > & *dspa*, Real \* *ptr*, const int *ptr\_len*)  
[static, private]**

copy DDACE point to RealVector copy DDACE point array to RealVectorArray copy DDACE point array to Real\*

References Dakota::abort\_handler().

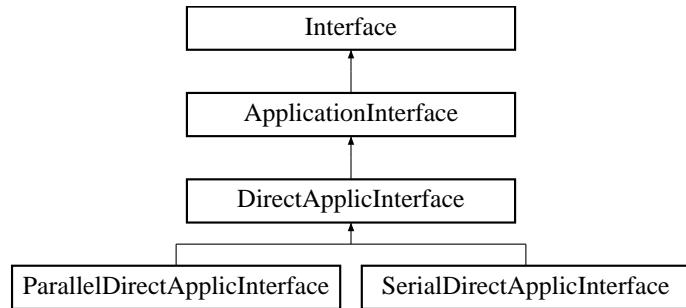

Referenced by DDACEDesignCompExp::get\_parameter\_sets().

The documentation for this class was generated from the following files:

- DDACEDesignCompExp.H
- DDACEDesignCompExp.C

## 43.33 DirectApplicInterface Class Reference

Derived application interface class which spawns simulation codes and testers using direct procedure calls. Inheritance diagram for DirectApplicInterface::

### Public Member Functions

- `DirectApplicInterface (const ProblemDescDB &problem_db)`  
*constructor*
- `~DirectApplicInterface ()`  
*destructor*
- `void derived_map (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)`  
*Called by `map()` and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*
- `void derived_map_asynch (const ParamResponsePair &pair)`  
*Called by `map()` and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*
- `void derived_synch (PRPQueue &prp_queue)`  
*For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.*
- `void derived_synch_nowait (PRPQueue &prp_queue)`  
*For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.*
- `int derived_synchronous_local_analysis (const int &analysis_id)`
- `const StringArray & analysis_drivers () const`  
*retrieve the analysis drivers specification for application interfaces*

## Protected Member Functions

- virtual int `derived_map_if` (const `Dakota::String &if_name`)  
*execute the input filter portion of a direct evaluation invocation*
- virtual int `derived_map_ac` (const `Dakota::String &ac_name`)  
*execute an analysis code portion of a direct evaluation invocation*
- virtual int `derived_map_of` (const `Dakota::String &of_name`)  
*execute the output filter portion of a direct evaluation invocation*
- void `set_local_data` (const `Variables &vars`, const `ActiveSet &set`, const `Response &response`)  
*convenience function for local test simulators which sets per-evaluation variable and response attributes*
- void `overlay_response` (`Response &response`)  
*convenience function for local test simulators which overlays response contributions from multiple analyses using MPI\_Reduce*

## Protected Attributes

- `String iFilterName`  
*name of the direct function input filter*
- `String oFilterName`  
*name of the direct function output filter*
- `driver_t iFilterType`  
*enum type of the direct function input filter*
- `driver_t oFilterType`  
*enum type of the direct function output filter*
- `bool gradFlag`  
*signals use of fnGrads in direct simulator functions*
- `bool hessFlag`  
*signals use of fnHessians in direct simulator functions*
- `size_t numFns`  
*number of functions in fnVals*
- `size_t numVars`  
*total number of continuous and discrete variables*
- `size_t numACV`

*total number of continuous variables*

- `size_t numADIV`

*total number of discrete integer variables*

- `size_t numADRV`

*total number of discrete real variables*

- `size_t numDerivVars`

*number of active derivative variables*

- `unsigned short local DataView`

*bit-wise record of which local data views are active; see enum local\_data\_t*

- `RealVector xC`

*continuous variables used within direct simulator fns*

- `IntVector xDI`

*discrete int variables used within direct simulator fns*

- `RealVector xDR`

*discrete real variables used within direct simulator fns*

- `StringMultiArray xCLabels`

*continuous variable labels*

- `StringMultiArray xDILabels`

*discrete integer variable labels*

- `StringMultiArray xDRLLabels`

*discrete real variable labels*

- `std::map< String, var_t > varTypeMap`

*whether the user requested numpy data structures*

### 43.33.1 Detailed Description

Derived application interface class which spawns simulation codes and testers using direct procedure calls. [DirectApplicInterface](#) uses a few linkable simulation codes and several internal member functions to perform parameter to response mappings.

### 43.33.2 Member Function Documentation

#### 43.33.2.1 int derived\_synchronous\_local\_analysis (const int & analysis\_id) [inline, virtual]

This code provides the derived function used by [ApplicationInterface::serve\\_analyses\\_synch\(\)](#).

Reimplemented from [ApplicationInterface](#).

References    [DirectApplicInterface::analysisDriverIndex](#),    [DirectApplicInterface::analysisDrivers](#),    and  
[DirectApplicInterface::derived\\_map\\_ac\(\)](#).

#### 43.33.2.2 int derived\_map\_ac (const Dakota::String & ac\_name) [protected, virtual]

execute an analysis code portion of a direct evaluation invocation When a direct analysis/filter is a member function, the (vars,set,response) data does not need to be passed through the API. If, however, non-member analysis/filter functions are added, then pass (vars,set,response) through to the non-member fns:

```
// API declaration
int sim(const Variables& vars, const ActiveSet& set, Response& response);
// use of API within derived_map_ac()
if (ac_name == "sim")
 fail_code = sim(directFnVars, directFnActSet, directFnResponse);
```

Reimplemented in [ParallelDirectApplicInterface](#), and [SerialDirectApplicInterface](#).

References    [Dakota::abort\\_handler\(\)](#),    [ApplicationInterface::analysisServerId](#),    [DirectApplicInterface::cantilever\(\)](#),    [DirectApplicInterface::cyl\\_head\(\)](#),    [DirectApplicInterface::driverTypeMap](#),

## 43.34 DiscrepancyCorrection Class Reference

Base class for discrepancy corrections.

### Public Member Functions

- **DiscrepancyCorrection ()**  
*default constructor*
- **DiscrepancyCorrection (Model &surr\_model, const IntSet &surr\_fn\_indices, short corr\_type, short corr\_order)**  
*standard constructor*
- **DiscrepancyCorrection (const IntSet &surr\_fn\_indices, size\_t num\_fns, size\_t num\_vars, short corr\_type, short corr\_order)**  
*alternate constructor*
- **~DiscrepancyCorrection ()**  
*destructor*
- **void initialize (Model &surr\_model, const IntSet &surr\_fn\_indices, short corr\_type, short corr\_order)**  
*initialize the *DiscrepancyCorrection* data*
- **void initialize (const IntSet &surr\_fn\_indices, size\_t num\_fns, size\_t num\_vars, short corr\_type, short corr\_order)**  
*initialize the *DiscrepancyCorrection* data*
- **void compute (const RealVector &c\_vars, const Response &truth\_response, const Response &approx\_response, bool quiet\_flag=false)**  
*compute the correction required to bring approx\_response into agreement with truth\_response and store in {add,mult}Corrections*
- **void compute (const Response &truth\_response, const Response &approx\_response, Response &discrepancy\_response, bool quiet\_flag=false)**  
*compute the correction required to bring approx\_response into agreement with truth\_response and store in discrepancy\_response*
- **void apply (const RealVector &c\_vars, Response &approx\_response, bool quiet\_flag=false)**  
*apply the correction computed in *compute()* to approx\_response*
- **bool active () const**  
*indicates an active correction via non-empty correctionType*
- **short correction\_type () const**  
*return correctionType*

- short `correction_order () const`  
`return correctionOrder`
- short `data_order () const`  
`return dataOrder`
- bool `computed () const`  
`return correctionComputed`

## Protected Attributes

- IntSet `surrogateFnIndices`  
*for mixed response sets, this array specifies the response function subset that is approximated*
- short `correctionType`  
*approximation correction approach to be used: NO\_CORRECTION, ADDITIVE\_CORRECTION, MULTIPLICATIVE\_CORRECTION, or COMBINED\_CORRECTION.*
- short `correctionOrder`  
*approximation correction order to be used: 0, 1, or 2*
- short `dataOrder`  
*order of correction data in 3-bit format: overlay of 1 (value), 2 (gradient), and 4 (Hessian)*
- bool `correctionComputed`  
*flag indicating whether or not a correction has been computed and is available for application*
- size\_t `numFns`  
*total number of response functions (of which surrogateFnIndices may define a subset)*
- size\_t `numVars`  
*number of continuous variables active in the correction*

## Private Member Functions

- void `initialize_corrections ()`  
*internal convenience function shared by overloaded `initialize()` variants*
- bool `check_scaling (const RealVector &truth_fns, const RealVector &approx_fns)`  
`define badScalingFlag`
- void `compute_additive (const Response &truth_response, const Response &approx_response, int index, Real &discrep_fn, RealVector &discrep_grad, RealSymMatrix &discrep_hess)`

*internal convenience function for computing additive corrections between truth and approximate responses*

- void [compute\\_multiplicative](#) (const [Response](#) &truth\_response, const [Response](#) &approx\_response, int index, Real &discrep\_fn, RealVector &discrep\_grad, RealSymMatrix &discrep\_hess)  
*internal convenience function for computing multiplicative corrections between truth and approximate responses*
- void [apply\\_additive](#) (const RealVector &c\_vars, [Response](#) &approx\_response)  
*internal convenience function for applying additive corrections to an approximate response*
- void [apply\\_multiplicative](#) (const RealVector &c\_vars, [Response](#) &approx\_response)  
*internal convenience function for applying multiplicative corrections to an approximate response*
- void [apply\\_additive](#) (const RealVector &c\_vars, RealVector &approx\_fns)  
*internal convenience function for applying additive corrections to a set of response functions*
- void [apply\\_multiplicative](#) (const RealVector &c\_vars, RealVector &approx\_fns)  
*internal convenience function for applying multiplicative corrections to a set of response functions*
- const [Response](#) & [search\\_db](#) (const RealVector &c\_vars, const ShortArray &search\_asv)  
*search data\_pairs for missing approximation data*

## Private Attributes

- bool [badScalingFlag](#)  
*flag used to indicate function values near zero for multiplicative corrections; triggers an automatic switch to additive corrections*
- bool [computeAdditive](#)  
*flag indicating the need for additive correction calculations*
- bool [computeMultiplicative](#)  
*flag indicating the need for multiplicative correction calculations*
- std::vector< [Approximation](#) > [addCorrections](#)  
*array of additive corrections; surrogate models of a model discrepancy function (formed from model differences)*
- std::vector< [Approximation](#) > [multCorrections](#)  
*array of multiplicative corrections; surrogate models of a model discrepancy function (formed from model ratios)*
- [Model](#) [surrModel](#)  
*shallow copy of the surrogate model instance as returned by [Model::surrogate\\_model\(\)](#) (the [DataFitSurrModel](#) or [HierarchSurrModel::lowFidelityModel](#) instance)*
- RealVector [combineFactors](#)

*factors for combining additive and multiplicative corrections. Each factor is the weighting applied to the additive correction and 1.-factor is the weighting applied to the multiplicative correction. The factor value is determined by an additional requirement to match the high fidelity function value at the previous correction point (e.g., previous trust region center). This results in a multipoint correction instead of a strictly local correction.*

- RealVector [correctionPrevCenterPt](#)

*copy of center point from the previous correction cycle*

- RealVector [truthFnsCenter](#)

*truth function values at the current correction point*

- RealVector [approxFnsCenter](#)

*Surrogate function values at the current correction point.*

- RealMatrix [approxGradsCenter](#)

*Surrogate gradient values at the current correction point.*

- RealVector [truthFnsPrevCenter](#)

*copy of truth function values at center of previous correction cycle*

- RealVector [approxFnsPrevCenter](#)

*copy of approximate function values at center of previous correction cycle*

### 43.34.1 Detailed Description

Base class for discrepancy corrections. The [DiscrepancyCorrection](#) class provides common functions for computing and applying corrections to approximations.

### 43.34.2 Member Function Documentation

#### 43.34.2.1 void compute (const RealVector & *c\_vars*, const Response & *truth\_response*, const Response & *approx\_response*, bool *quiet\_flag* = **false**)

compute the correction required to bring *approx\_response* into agreement with *truth\_response* and store in {add,mult}Corrections Compute an additive or multiplicative correction that corrects the *approx\_response* to have 0th-order consistency (matches values), 1st-order consistency (matches values and gradients), or 2nd-order consistency (matches values, gradients, and Hessians) with the *truth\_response* at a single point (e.g., the center of a trust region). The 0th-order, 1st-order, and 2nd-order corrections use scalar values, linear scaling functions, and quadratic scaling functions, respectively, for each response function.

- RealArray **constraintMappingOffsets**

*a container of offsets for mapping the [Response](#) constraints to the DOT constraints.*

### 43.35.1 Detailed Description

Wrapper class for the DOT optimization library. The [DOTOptimizer](#) class provides a wrapper for DOT, a commercial Fortran 77 optimization library from Vanderplaats Research and Development. It uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see [NPSOLOptimizer](#) and [SNLLOptimizer](#)).

The user input mappings are as follows: `max_iterations` is mapped into DOT's `ITMAX` parameter within its `IPRM` array, `max_function_evaluations` is implemented directly in the `find_optimum()` loop since there is no DOT parameter equivalent, `convergence_tolerance` is mapped into DOT's `DELOBJ` parameter (the relative convergence tolerance) within its `RPRM` array, `output` verbosity is mapped into DOT's `IPRINT` parameter within its function call parameter list (verbose: `IPRINT = 7`; quiet: `IPRINT = 3`), and `optimization_type` is mapped into DOT's `MINMAX` parameter within its function call parameter list. Refer to [Vanderplaats Research and Development, 1995] for information on `IPRM`, `RPRM`, and the DOT function call parameter list.

### 43.35.2 Member Data Documentation

#### 43.35.2.1 int dotInfo [private]

INFO from DOT manual. Information requested by DOT: 0=optimization complete, 1=get values, 2=get gradients  
Referenced by `DOTOptimizer::find_optimum()`, and `DOTOptimizer::initialize_run()`.

**43.35.2.2 int dotFDSinfo [private]**

internal DOT parameter NGOTOZ the DOT parameter list has been modified to pass NGOTOZ, which signals whether DOT is finite-differencing (nonzero value) or performing the line search (zero value).

Referenced by DOTOptimizer::find\_optimum().

**43.35.2.3 int dotMethod [private]**

METHOD from DOT manual. For nonlinear constraints: 0/1 = dot\_mffd, 2 = dot\_slp, 3 = dot\_sqp. For unconstrained: 0/1 = dot\_bfgs, 2 = dot\_frcg.

Referenced by DOTOptimizer::allocate\_constraints(), DOTOptimizer::allocate\_workspace(), DOTOptimizer::DOTOptimizer(), and DOTOptimizer::find\_optimum().

**43.35.2.4 int printControl [private]**

IPRINT from DOT manual (controls output verbosity). Values range from 0 (least output) to 7 (most output).

Referenced by DOTOptimizer::DOTOptimizer(), and DOTOptimizer::find\_optimum().

**43.35.2.5 int optimizationType [private]**

MINMAX from DOT manual (minimize or maximize). Values of 0 or -1 (minimize) or 1 (maximize).

Referenced by DOTOptimizer::DOTOptimizer(), and DOTOptimizer::find\_optimum().

**43.35.2.6 RealArray realCtlParmArray [private]**

RPRM from DOT manual. Array of real control parameters.

Referenced by DOTOptimizer::find\_optimum(), and DOTOptimizer::initialize().

**43.35.2.7 IntArray intCtlParmArray [private]**

IPRM from DOT manual. Array of integer control parameters.

Referenced by DOTOptimizer::find\_optimum(), and DOTOptimizer::initialize().

**43.35.2.8 RealVector constraintValues [private]**

array of nonlinear constraint values passed to DOT This array must be of nonzero length and must contain only one-sided inequality constraints which are  $\leq 0$  (which requires a transformation from 2-sided inequalities and equalities).

Referenced by DOTOptimizer::allocate\_constraints(), and DOTOptimizer::find\_optimum().

**43.35.2.9 SizetArray constraintMappingIndices [private]**

a container of indices for referencing the corresponding [Response](#) constraints used in computing the DOT constraints. The length of the container corresponds to the number of DOT constraints, and each entry in the container points to the corresponding DAKOTA constraint.

Referenced by `DOTOptimizer::allocate_constraints()`, and `DOTOptimizer::find_optimum()`.

**43.35.2.10 RealArray constraintMappingMultipliers [private]**

a container of multipliers for mapping the [Response](#) constraints to the DOT constraints. The length of the container corresponds to the number of DOT constraints, and each entry in the container stores a multiplier for the DAKOTA constraint identified with `constraintMappingIndices`. These multipliers are currently +1 or -1.

Referenced by `DOTOptimizer::allocate_constraints()`, and `DOTOptimizer::find_optimum()`.

**43.35.2.11 RealArray constraintMappingOffsets [private]**

a container of offsets for mapping the [Response](#) constraints to the DOT constraints. The length of the container corresponds to the number of DOT constraints, and each entry in the container stores an offset for the DAKOTA constraint identified with `constraintMappingIndices`. These offsets involve inequality bounds or equality targets, since DOT assumes constraint allowables = 0.

Referenced by `DOTOptimizer::allocate_constraints()`, and `DOTOptimizer::find_optimum()`.

The documentation for this class was generated from the following files:

- `DOTOptimizer.H`
- `DOTOptimizer.C`

## 43.36 Driver Class Reference

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

### Public Member Functions

- `GeneticAlgorithm * ExtractAllData (const AlgorithmConfig &algConfig)`  
*Reads all required data from the problem description database stored in the supplied algorithm config.*
- `DesignOFSortSet PerformIterations (GeneticAlgorithm *theGA)`  
*Performs the required iterations on the supplied GA.*
- `void DestroyAlgorithm (GeneticAlgorithm *theGA)`  
*Deletes the supplied GA.*
- `Driver (const ProblemConfig &probConfig)`  
*Default constructs a `Driver`.*

### 43.36.1 Detailed Description

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm. This is necessary because DAKOTA requires that all problem information be extracted from the problem description DB at the time of `Optimizer` construction and the front end does it all in the execute algorithm method which must be called in `find_optimum`.

### 43.36.2 Constructor & Destructor Documentation

#### 43.36.2.1 `Driver (const ProblemConfig & probConfig) [inline]`

Default constructs a `Driver`.

##### Parameters:

`probConfig` The definition of the problem to be solved by this `Driver` whenever `ExecuteAlgorithm` is called.

The problem can be solved in multiple ways by multiple algorithms even using multiple different evaluators by issuing multiple calls to `ExecuteAlgorithm` with different `AlgorithmConfigs`.

### 43.36.3 Member Function Documentation

#### 43.36.3.1 `GeneticAlgorithm* ExtractAllData (const AlgorithmConfig & algConfig) [inline]`

Reads all required data from the problem description database stored in the supplied algorithm config. The returned GA is fully configured and ready to be run. It must also be destroyed at some later time. You MUST call

DestroyAlgorithm for this purpose. Failure to do so could result in a memory leak and an eventual segmentation fault! Be sure to call DestroyAlgorithm prior to destroying the algorithm config that was used to create it!

This is just here to expose the base class method to users.

**Parameters:**

*algConfig* The fully loaded configuration object containing the database of parameters for the algorithm to be run on the known problem.

**Returns:**

The fully configured and loaded GA ready to be run using the PerformIterations method.

Referenced by JEGAOptimizer::find\_optimum().

**43.36.3.2 DesignOFSortSet PerformIterations (GeneticAlgorithm \* *theGA*) [inline]**

Performs the required iterations on the supplied GA. This includes the calls to AlgorithmInitialize and AlgorithmFinalize and logs some information if appropriate.

This is just here to expose the base class method to users.

**Parameters:**

*theGA* The GA on which to perform iterations. This parameter must be non-null.

**Returns:**

The final solutions reported by the supplied GA after all iterations and call to AlgorithmFinalize.

Referenced by JEGAOptimizer::find\_optimum().

**43.36.3.3 void DestroyAlgorithm (GeneticAlgorithm \* *theGA*) [inline]**

Deletes the supplied GA. Use this method to destroy a GA after all iterations have been run. This method knows if the log associated with the GA was created here and needs to be destroyed as well or not.

This is just here to expose the base class method to users.

Be sure to use this prior to destroying the algorithm config object which contains the target. The GA destructor needs the target to be in tact.

**Parameters:**

*theGA* The algorithm that is no longer needed and thus must be destroyed.

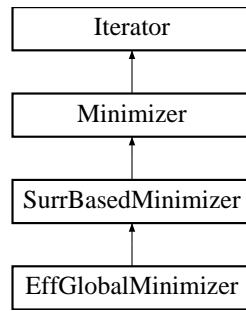

Referenced by JEGAOptimizer::find\_optimum().

The documentation for this class was generated from the following file:

- [JEGAOptimizer.C](#)

## 43.37 EffGlobalMinimizer Class Reference

Implementation of Efficient Global Optimization/Least Squares algorithms. Inheritance diagram for EffGlobalMinimizer::

### Public Member Functions

- **EffGlobalMinimizer (Model &model)**  
*standard constructor*
- **~EffGlobalMinimizer ()**  
*alternate constructor for instantiations "on the fly"*
- **void minimize\_surrogates ()**  
*Used for computing the optimal solution using a surrogate-based approach. Redefines the `Iterator::run()` virtual function.*
- **const Model & algorithm\_space\_model () const**  
*return the result of any recasting or surrogate model recursion layered on top of iteratedModel by the derived `Iterator` ctor chain*

### Private Member Functions

- **void minimize\_surrogates\_on\_model ()**  
*called by minimize\_surrogates for `setUpType == "model"`*
- **void get\_best\_sample ()**  
*called by minimize\_surrogates for `setUpType == "user_functions"`*
- **Real expected\_improvement (const RealVector &means, const RealVector &variances)**  
*expected improvement function for the GP*
- **RealVector expectedViolation (const RealVector &means, const RealVector &variances)**  
*expected violation function for the constraint functions*

- void [update\\_penalty \(\)](#)  
*initialize and update the penaltyParameter*

## Static Private Member Functions

- static void [EIF\\_objective\\_eval](#) (const [Variables](#) &sub\_model\_vars, const [Variables](#) &recast\_vars, const [Response](#) &sub\_model\_response, [Response](#) &recast\_response)  
*static function used as the objective function in the Expected Improvement (EIF) problem formulation for PMA*

## Private Attributes

- [String setUpType](#)  
*controls iteration mode: "model" (normal usage) or "user\_functions" (user-supplied functions mode for "on the fly" instantiations).*
- [Model fHatModel](#)  
*GP model of response, one approximation per response function.*
- [Model eifModel](#)  
*recast model which assimilates mean and variance to solve the max(EIF) sub-problem*
- [Real meritFnStar](#)  
*minimum penalized response from among true function evaluations*
- [RealVector truthFnStar](#)  
*true function values corresponding to the minimum penalized response*
- [RealVector varStar](#)  
*point that corresponds to the optimal value meritFnStar*
- [short dataOrder](#)  
*order of the data used for surrogate construction, in [ActiveSet](#) request vector 3-bit format; user may override responses spec*

## Static Private Attributes

- static [EffGlobalMinimizer \\* effGlobalInstance](#)  
*pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data*

### 43.37.1 Detailed Description

Implementation of Efficient Global Optimization/Least Squares algorithms. The [EffGlobalMinimizer](#) class provides an implementation of the Efficient Global Optimization algorithm developed by Jones, Schonlau, & Welch as well as adaptation of the concept to nonlinear least squares.

### 43.37.2 Constructor & Destructor Documentation

#### 43.37.2.1 ~EffGlobalMinimizer ()

alternate constructor for instantiations "on the fly" destructor

This is an alternate constructor for instantiations on the fly using a [Model](#) but no [ProblemDescDB](#).

References [SurrBasedMinimizer::approxSubProbMinimizer](#), [EffGlobalMinimizer::eifModel](#), [Model::free\\_-communicators\(\)](#), and [Iterator::maximum\\_concurrency\(\)](#).

### 43.37.3 Member Function Documentation

#### 43.37.3.1 void get\_best\_sample () [private]

called by [minimize\\_surrogates](#) for [setUpType == "user\\_functions"](#) determine best solution from among sample data for expected improvement function

References [Model::approximation\\_data\(\)](#), [SurrBasedMinimizer::augmented\\_lagrangian\\_merit\(\)](#), [Model::compute\\_response\(\)](#), [Model::continuous\\_variables\(\)](#), [Dakota::copy\\_data\(\)](#), [Model::current\\_response\(\)](#), [EffGlobalMinimizer::fHatModel](#), [Response::function\\_values\(\)](#), [Iterator::iteratedModel](#), [EffGlobalMinimizer::meritFnStar](#), [Iterator::numFunctions](#), [SurrBasedMinimizer::origNonlinEqTargets](#), [SurrBasedMinimizer::origNonlinIneqLowerBnds](#), [SurrBasedMinimizer::origNonlinIneqUpperBnds](#), [Model::primary\\_-response\\_fn\\_weights\(\)](#), [EffGlobalMinimizer::truthFnStar](#), and [EffGlobalMinimizer::varStar](#).

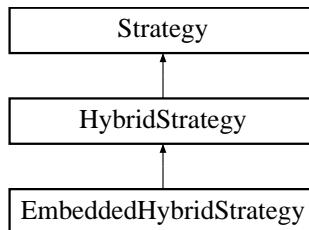

Referenced by [EffGlobalMinimizer::minimize\\_surrogates\\_on\\_model\(\)](#).

The documentation for this class was generated from the following files:

- [EffGlobalMinimizer.H](#)
- [EffGlobalMinimizer.C](#)

## 43.38 EmbeddedHybridStrategy Class Reference

[Strategy](#) for closely-coupled hybrid minimization, typically involving the embedding of local search methods within global search methods. Inheritance diagram for EmbeddedHybridStrategy::

### Public Member Functions

- [EmbeddedHybridStrategy \(ProblemDescDB &problem\\_db\)](#)  
*constructor*
- [~EmbeddedHybridStrategy \(\)](#)  
*destructor*

### Protected Member Functions

- void [run\\_strategy \(\)](#)  
*Performs the hybrid minimization strategy by executing multiple iterators on different models of varying fidelity.*
- const [Variables & variables\\_results \(\) const](#)  
*return the final solution from selectedIterators (variables)*
- const [Response & response\\_results \(\) const](#)  
*return the final solution from selectedIterators (response)*

### Private Attributes

- Real [localSearchProb](#)  
*the probability of running a local search refinement within phases of the global minimization for coupled hybrids*

#### 43.38.1 Detailed Description

[Strategy](#) for closely-coupled hybrid minimization, typically involving the embedding of local search methods within global search methods. This strategy uses multiple methods in close coordination, generally using a local

search minimizer repeatedly within a global minimizer (the local search minimizer refines candidate minima which are fed back to the global minimizer).

The documentation for this class was generated from the following files:

- `EmbeddedHybridStrategy.H`
- `EmbeddedHybridStrategy.C`

## 43.39 Evaluator Class Reference

An evaluator specialization that knows how to interact with [Dakota](#).

### Public Member Functions

- virtual bool [Evaluate](#) (DesignGroup &group)  
*Does evaluation of each design in group.*
- virtual bool [Evaluate](#) (Design &des)  
*This method cannot be used!!*
- virtual std::string [GetName](#) () const  
*Returns the proper name of this operator.*
- virtual std::string [GetDescription](#) () const  
*Returns a full description of what this operator does and how.*
- virtual GeneticAlgorithmOperator \* [Clone](#) (GeneticAlgorithm &algorithm) const  
*Creates and returns a pointer to an exact duplicate of this operator.*
- [Evaluator](#) (GeneticAlgorithm &algorithm, [Model](#) &model)  
*Constructs a [Evaluator](#) for use by algorithm.*
- [Evaluator](#) (const [Evaluator](#) &copy)  
*Copy constructs a [Evaluator](#).*
- [Evaluator](#) (const [Evaluator](#) &copy, GeneticAlgorithm &algorithm, [Model](#) &model)  
*Copy constructs a [Evaluator](#) for use by algorithm.*

### Static Public Member Functions

- static const std::string & [Name](#) ()  
*Returns the proper name of this operator.*
- static const std::string & [Description](#) ()  
*Returns a full description of what this operator does and how.*

### Protected Member Functions

- void [SeparateVariables](#) (const Design &from, RealVector &intoCont, IntVector &intoDiscInt, RealVector &intoDiscReal) const  
*This method fills intoCont, intoDiscInt and intoDiscReal appropriately using the values of from.*

- void [RecordResponses](#) (const RealVector &from, Design &into) const  
*Records the computed objective and constraint function values into into.*
- std::size\_t [GetNumberNonLinearConstraints](#) () const  
*Returns the number of non-linear constraints for the problem.*
- std::size\_t [GetNumberLinearConstraints](#) () const  
*Returns the number of linear constraints for the problem.*

## Private Member Functions

- [Evaluator](#) (GeneticAlgorithm &algorithm)  
*This constructor has no implementation and cannot be used.*

## Private Attributes

- [Model](#) & [\\_model](#)  
*The [Model](#) known by this evaluator.*

### 43.39.1 Detailed Description

An evaluator specialization that knows how to interact with [Dakota](#). This evaluator knows how to use the model to do evaluations both in synchronous and asynchronous modes.

### 43.39.2 Constructor & Destructor Documentation

#### 43.39.2.1 [Evaluator](#) ([GeneticAlgorithm](#) & *algorithm*, [Model](#) & *model*) [inline]

Constructs a [Evaluator](#) for use by *algorithm*. The optimizer is needed for purposes of variable scaling.

##### Parameters:

- algorithm*** The GA for which the new evaluator is to be used.  
***model*** The model through which evaluations will be done.

Referenced by [Evaluator::Clone\(\)](#).

### 43.39.2.2 Evaluator (const Evaluator & *copy*) [inline]

Copy constructs a [Evaluator](#).

**Parameters:**

*copy* The evaluator from which properties are to be duplicated into this.

### 43.39.2.3 Evaluator (const Evaluator & *copy*, GeneticAlgorithm & *algorithm*, Model & *model*) [inline]

Copy constructs a [Evaluator](#) for use by *algorithm*. The optimizer is needed for purposes of variable scaling.

**Parameters:**

*copy* The existing [Evaluator](#) from which to retrieve properties.

*algorithm* The GA for which the new evaluator is to be used.

*model* The model through which evaluations will be done.

### 43.39.2.4 Evaluator (GeneticAlgorithm & *algorithm*) [private]

This constructor has no implementation and cannot be used. This constructor can never be used. It is provided so that this operator can still be registered in an operator registry even though it can never be instantiated from there.

**Parameters:**

*algorithm* The GA for which the new evaluator is to be used.

## 43.39.3 Member Function Documentation

### 43.39.3.1 static const std::string& Name () [inline, static]

Returns the proper name of this operator.

**Returns:**

The string "DAKOTA JEGA Evaluator".

Referenced by [Evaluator::GetName\(\)](#).

### 43.39.3.2 static const std::string& Description () [inline, static]

Returns a full description of what this operator does and how. The returned text is:

```
This evaluator uses Sandia's DAKOTA optimization
software to evaluate the passed in Designs. This
makes it possible to take advantage of the fact that
DAKOTA is designed to run on massively parallel machines.
```

**Returns:**

A description of the operation of this operator.

Referenced by Evaluator::GetDescription().

**43.39.3.3 void SeparateVariables (const Design & *from*, RealVector & *intoCont*, IntVector & *intoDiscInt*, RealVector & *intoDiscReal*) const [protected]**

This method fills *intoCont*, *intoDiscInt* and *intoDiscReal* appropriately using the values of *from*. The discrete integer design variable values are placed in *intoDiscInt*, the discrete real design variable values are placed in *intoDiscReal*, and the continuum are placed into *intoCont*. The values are written into the vectors from the beginning so any previous contents of the vectors will be overwritten.

**Parameters:**

*from* The Design class object from which to extract the discrete design variable values.

*intoDiscInt* The vector into which to place the extracted discrete integer values.

*intoDiscReal* The vector into which to place the extracted discrete real values.

*intoCont* The vector into which to place the extracted continuous values.

References Evaluator::\_model, Model::cv(), Model::discrete\_design\_set\_int\_values(), Model::discrete\_design\_set\_real\_values(), Model::div(), and Model::drv().

Referenced by Evaluator::Evaluate().

**43.39.3.4 void RecordResponses (const RealVector & *from*, Design & *into*) const [protected]**

Records the computed objective and constraint function values into *into*. This method takes the response values stored in *from* and properly transfers them into the *into* design.

The response vector *from* is expected to contain values for each objective function followed by values for each non-linear constraint in the order in which the info objects were loaded into the target by the optimizer class.

**Parameters:**

*from* The vector of responses to install into *into*.

*into* The Design to which the responses belong and into which they must be written.

References Evaluator::GetNumberNonLinearConstraints().

Referenced by Evaluator::Evaluate().

**43.39.3.5 std::size\_t GetNumberNonLinearConstraints () const [inline, protected]**

Returns the number of non-linear constraints for the problem. This is computed by adding the number of non-linear equality constraints to the number of non-linear inequality constraints. These values are obtained from the model.

**Returns:**

The total number of non-linear constraints.

References `Evaluator::model`, `Model::num_nonlinear_eq_constraints()`, and `Model::num_nonlinear_ineq_constraints()`.

Referenced by `Evaluator::Evaluate()`, and `Evaluator::RecordResponses()`.

**43.39.3.6 std::size\_t GetNumberLinearConstraints () const [inline, protected]**

Returns the number of linear constraints for the problem. This is computed by adding the number of linear equality constraints to the number of linear inequality constraints. These values are obtained from the model.

**Returns:**

The total number of linear constraints.

References `Evaluator::model`, `Model::num_linear_eq_constraints()`, and `Model::num_linear_ineq_constraints()`.

**43.39.3.7 bool Evaluate (DesignGroup & group) [virtual]**

Does evaluation of each design in *group*. This method uses the `Model` known by this class to get Designs evaluated. It properly formats the Design class information in a way that `Dakota` will understand and then interprets the `Dakota` results and puts them back into the Design class object. It respects the asynchronous flag in the `Model` so evaluations may occur synchronously or asynchronously.

Prior to evaluating a Design, this class checks to see if it is marked as already evaluated. If it is, then the evaluation of that Design is not carried out. This is not strictly necessary because `Dakota` keeps track of evaluated designs and does not re-evaluate. An exception is the case of a population read in from a file complete with responses where `Dakota` is unaware of the evaluations.

**Parameters:**

*group* The group of Design class objects to be evaluated.

**Returns:**

true if all evaluations completed and false otherwise.

References `Evaluator::model`, `Model::asynch_compute_response()`, `Model::asynch_flag()`, `Model::compute_response()`, `Model::continuous_variables()`, `Model::current_response()`, `Model::discrete_int_variables()`, `Model::discrete_real_variables()`, `Response::function_values()`, `Evaluator::GetName()`, `Evaluator::GetNumberNonLinearConstraints()`, `Evaluator::RecordResponses()`, `Evaluator::SeparateVariables()`, and `Model::synchronize()`.

**43.39.3.8 virtual bool Evaluate (Design & des) [inline, virtual]**

This method cannot be used!! This method does nothing and cannot be called. This is because in the case of asynchronous evaluation, this method would be unable to conform. It would require that each evaluation be done in a synchronous fashion.

**Parameters:**

*des* A Design that would be evaluated if this method worked.

**Returns:**

Would return true if the Design were evaluated and false otherwise. Never actually returns here. Issues a fatal error. Otherwise, it would always return false.

References Evaluator::GetName().

**43.39.3.9 virtual std::string GetName () const [inline, virtual]**

Returns the proper name of this operator.

**Returns:**

See [Name\(\)](#).

References Evaluator::Name().

Referenced by Evaluator::Evaluate().

**43.39.3.10 virtual std::string GetDescription () const [inline, virtual]**

Returns a full description of what this operator does and how.

**Returns:**

See [Description\(\)](#).

References Evaluator::Description().

**43.39.3.11 virtual GeneticAlgorithmOperator\* Clone (GeneticAlgorithm & *algorithm*) const [inline, virtual]**

Creates and returns a pointer to an exact duplicate of this operator.

**Parameters:**

*algorithm* The GA for which the clone is being created.

**Returns:**

A clone of this operator.

References Evaluator::\_model, and Evaluator::Evaluator().

## 43.39.4 Member Data Documentation

### 43.39.4.1 Model& \_model [private]

The [Model](#) known by this evaluator. It is through this model that evaluations will take place.

Referenced by Evaluator::Clone(), Evaluator::Evaluate(), Evaluator::GetNumberLinearConstraints(), Evaluator::GetNumberNonLinearConstraints(), and Evaluator::SeparateVariables().

The documentation for this class was generated from the following file:

- [JEGAOptimizer.C](#)

## 43.40 EvaluatorCreator Class Reference

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a [Evaluator](#).

### Public Member Functions

- virtual GeneticAlgorithmEvaluator \* [CreateEvaluator](#) (GeneticAlgorithm &alg)  
*Overridden to return a newly created [Evaluator](#).*
- [EvaluatorCreator](#) ([Model](#) &theModel)  
*Constructs an [EvaluatorCreator](#) using the supplied model.*

### Private Attributes

- [Model](#) & [\\_theModel](#)  
*The user defined model to be passed to the constructor of the [Evaluator](#).*

### 43.40.1 Detailed Description

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a [Evaluator](#).

### 43.40.2 Constructor & Destructor Documentation

#### 43.40.2.1 [EvaluatorCreator](#) ([Model](#) & [theModel](#)) [inline]

Constructs an [EvaluatorCreator](#) using the supplied model.

##### Parameters:

*theModel* The [Dakota::Model](#) this creator will pass to the created evaluator.

### 43.40.3 Member Function Documentation

#### 43.40.3.1 virtual GeneticAlgorithmEvaluator\* [CreateEvaluator](#) (GeneticAlgorithm & *alg*) [inline, virtual]

Overridden to return a newly created [Evaluator](#). The GA will assume ownership of the evaluator so we needn't worry about keeping track of it for destruction. The additional parameters needed by the [Evaluator](#) are stored as members of this class at construction time.

##### Parameters:

*alg* The GA for which the evaluator is to be created.

**Returns:**

A pointer to a newly created [Evaluator](#).

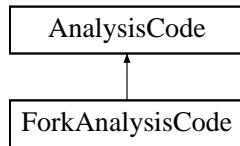

References `EvaluatorCreator::_theModel`.

The documentation for this class was generated from the following file:

- [JEGAOptimizer.C](#)

## 43.41 ForkAnalysisCode Class Reference

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using forks. Inheritance diagram for ForkAnalysisCode::

### Public Member Functions

- [ForkAnalysisCode](#) (const [ProblemDescDB](#) &problem\_db)  
*constructor*
- [~ForkAnalysisCode](#) ()  
*destructor*
- pid\_t [fork\\_program](#) (const bool block\_flag)  
*spawn a child process using fork()/vfork()/execvp() and wait for completion using waitpid() if block\_flag is true*
- void [check\\_status](#) (const int status)  
*check the exit status of a forked process and abort if an error code was returned*
- void [ifilter\\_argument\\_list](#) ()  
*set argList for execution of the input filter*
- void [ofilter\\_argument\\_list](#) ()  
*set argList for execution of the output filter*
- void [driver\\_argument\\_list](#) (const int analysis\_id)  
*set argList for execution of the specified analysis driver*

### Private Attributes

- std::vector< std::string > [argList](#)  
*an array of strings for use with execvp(const char \*, char \* const \*). These are converted to an array of const char\*'s in [fork\\_program\(\)](#).*

### 43.41.1 Detailed Description

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using forks. [ForkAnalysisCode](#) creates a copy of the parent DAKOTA process using fork()/vfork() and then replaces the copy with a simulation process using execvp(). The parent process can then use waitpid() to wait on completion of the simulation process.

### 43.41.2 Member Function Documentation

#### 43.41.2.1 void check\_status (const int *status*)

check the exit status of a forked process and abort if an error code was returned. Check to see if the process terminated abnormally (WIFEXITED(status)==0) or if either execvp or the application returned a status code of -1 (WIFEXITED(status)!=0 && (signed char)WEXITSTATUS(status)==-1). If one of these conditions is detected, output a failure message and abort. Note: the application code should not return a status code of -1 unless an immediate abort of dakota is wanted. If for instance, failure capturing is to be used, the application code should write the word "FAIL" to the appropriate results file and return a status code of 0 through exit().

References Dakota::abort\_handler().

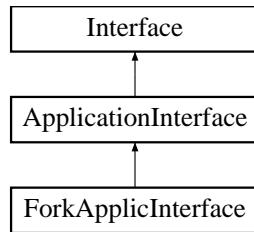

Referenced by ForkApplicInterface::asynchronous\_local\_analyses(), ForkApplicInterface::derived\_synch(), ForkApplicInterface::derived\_synch\_nowait(), ForkAnalysisCode::fork\_program(), and ForkApplicInterface::serve\_analyses\_asynch().

*map of fork process id's to function evaluation id's for asynchronous evaluations*

### 43.42.1 Detailed Description

Derived application interface class which spawns simulation codes using forks. [ForkApplicInterface](#) uses a [ForkAnalysisCode](#) object for performing simulation invocations.

### 43.42.2 Member Function Documentation

#### 43.42.2.1 int derived\_synchronous\_local\_analysis (const int & analysis\_id) [inline, virtual]

This code provides the derived function used by [ApplicationInterface:: serve\\_analyses\\_synch\(\)](#) as well as a convenience function for [ForkApplicInterface::synchronous\\_local\\_analyses\(\)](#) below.

Reimplemented from [ApplicationInterface](#).

References [ForkAnalysisCode::driver\\_argument\\_list\(\)](#), [ForkAnalysisCode::fork\\_program\(\)](#), and [ForkApplicInterface::forkSimulator](#).

Referenced by [ForkApplicInterface::synchronous\\_local\\_analyses\(\)](#).

**43.42.2.2 pid\_t fork\_application (const bool *block\_flag*) [private]**

perform the complete function evaluation by managing the input filter, analysis programs, and output filter Manage the input filter, 1 or more analysis programs, and the output filter in blocking or nonblocking mode as governed by *block\_flag*. In the case of a single analysis and no filters, a single fork is performed, while in other cases, an initial fork is reforked multiple times. Called from [derived\\_map\(\)](#) with *block\_flag* == BLOCK and from [derived\\_map\\_asynch\(\)](#) with *block\_flag* == FALL\_THROUGH. Uses [ForkAnalysisCode::fork\\_program\(\)](#) to spawn individual program components within the function evaluation.

References Dakota::abort\_handler(), ApplicationInterface::analysisServerId, ApplicationInterface::asynchLocalAnalysisConcurrency, ApplicationInterface::asynchLocalAnalysisFlag, ForkApplicInterface::asynchronous\_local\_analyses(), ParallelLibrary::barrier\_e(), AnalysisCode::command\_line\_arguments(), ForkAnalysisCode::driver\_argument\_list(), ApplicationInterface::eaDedMasterFlag, ApplicationInterface::evalCommRank, ApplicationInterface::evalCommSize, ForkAnalysisCode::fork\_program(), ForkApplicInterface::forkSimulator, ForkAnalysisCode::ifilter\_argument\_list(), AnalysisCode::input\_filter\_name(), AnalysisCode::multiple\_parameters\_filenames(), ApplicationInterface::numAnalysisDrivers, ApplicationInterface::numAnalysisServers, ForkAnalysisCode::ofilter\_argument\_list(), AnalysisCode::output\_filter\_name(), Interface::outputLevel, ApplicationInterface::parallelLib, AnalysisCode::parameters\_filename(), AnalysisCode::program\_names(), AnalysisCode::results\_filename(), ApplicationInterface::self\_schedule\_analyses(), ForkApplicInterface::serve\_analyses\_asynch(), ApplicationInterface::serve\_analyses\_synch(), AnalysisCode::suppress\_output\_flag(), ApplicationInterface::suppressOutput, and ForkApplicInterface::synchronous\_local\_analyses().

Referenced by ForkApplicInterface::derived\_map(), and ForkApplicInterface::derived\_map\_asynch().

**43.42.2.3 void asynchronous\_local\_analyses (const int & *start*, const int & *end*, const int & *step*) [private]**

execute analyses asynchronously on the local processor Schedule analyses asynchronously on the local processor using a self-scheduling approach (start to end in step increments). Concurrency is limited by asynchLocalAnalysisConcurrency. Modeled after [ApplicationInterface::asynchronous\\_local\\_evaluations\(\)](#). NOTE: This function should be elevated to [ApplicationInterface](#) if and when another derived interface class supports asynchronous local analyses.

References Dakota::abort\_handler(), ApplicationInterface::asynchLocalAnalysisConcurrency, ForkAnalysisCode::check\_status(), ForkAnalysisCode::driver\_argument\_list(), Dakota::find\_index(), ForkAnalysisCode::fork\_program(), ForkApplicInterface::forkSimulator, ApplicationInterface::numAnalysisDrivers, and ForkApplicInterface::processIdMap.

Referenced by ForkApplicInterface::fork\_application().

**43.42.2.4 void synchronous\_local\_analyses (const int & *start*, const int & *end*, const int & *step*) [inline, private]**

execute analyses synchronously on the local processor Execute analyses synchronously in succession on the local processor (start to end in step increments). Modeled after [ApplicationInterface::synchronous\\_local\\_evaluations\(\)](#).

References ForkApplicInterface::derived\_synchronous\_local\_analysis().

Referenced by ForkApplicInterface::fork\_application().

**43.42.2.5 void serve\_analyses\_asynch () [private]**

serve the analysis scheduler and execute analysis jobs asynchronously This code runs multiple asynch analyses on each server. It is modeled after [ApplicationInterface::serve\\_evaluations\\_asynch\(\)](#). NOTE: This fn should be elevated to [ApplicationInterface](#) if and when another derived interface class supports hybrid analysis parallelism.

References Dakota::abort\_handler(), ApplicationInterface::asynchLocalAnalysisConcurrency, ForkAnalysisCode::check\_status(), ForkAnalysisCode::driver\_argument\_list(), Dakota::find\_index(), ForkAnalysisCode::fork\_program(), ForkApplicInterface::forkSimulator, ParallelLibrary::irecv\_ea(), ApplicationInterface::numAnalysisDrivers, ApplicationInterface::parallelLib, ForkApplicInterface::processIdMap, ParallelLibrary::recv\_ea(), ParallelLibrary::send\_ea(), and ParallelLibrary::test().

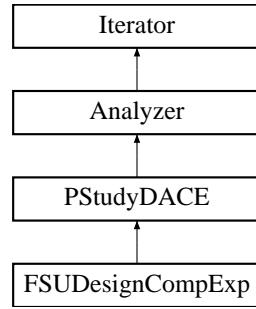

Referenced by ForkApplicInterface::fork\_application().

The documentation for this class was generated from the following files:

## 43.43 FSUDesignCompExp Class Reference

Wrapper class for the FSUDace QMC/CVT library. Inheritance diagram for FSUDesignCompExp::

### Public Member Functions

- **`FSUDesignCompExp (Model &model)`**  
*primary constructor for building a standard DACE iterator*
- **`FSUDesignCompExp (Model &model, int samples, int seed, const String &sampling_method)`**  
*alternate constructor for building a DACE iterator on-the-fly*
- **`~FSUDesignCompExp ()`**  
*destructor*
- **`void pre_run ()`**  
*pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori*
- **`void extract_trends ()`**  
*Redefines the run\_iterator virtual function for the PStudy/DACE branch.*
- **`void post_input ()`**  
*read tabular data for post-run mode*
- **`void post_run (std::ostream &s)`**  
*post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way*
- **`int num_samples () const`**  
*get the current number of samples*
- **`void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)`**  
*reset sampling iterator to use at least min\_samples*

- const `String & sampling_scheme () const`  
*return sampling name*
- void `vary_pattern (bool pattern_flag)`  
*sets varyPattern in derived classes that support it*
- void `get_parameter_sets (Model &model)`  
*Returns one block of samples (ndim \* num\_samples).*

## Private Member Functions

- void `enforce_input_rules ()`  
*enforce sanity checks/modifications for the user input specification*

## Private Attributes

- int `samplesSpec`  
*initial specification of number of samples*
- int `numSamples`  
*current number of samples to be evaluated*
- bool `allDataFlag`  
*flag which triggers the update of allVars/allResponses for use by `Iterator::all_variables()` and `Iterator::all_responses()`*
- size\_t `numDACERuns`  
*counter for number of `run()` executions for this object*
- bool `latinizeFlag`  
*flag which specifies latinization of QMC or CVT sample sets*
- IntVector `sequenceStart`  
*Integer vector defining a starting index into the sequence for random variable sampled. Default is 0 0 0 (e.g. for three random variables).*
- IntVector `sequenceLeap`  
*Integer vector defining the leap number for each sequence being generated. Default is 1 1 1 (e.g. for three random vars.).*
- IntVector `primeBase`  
*Integer vector defining the prime base for each sequence being generated. Default is 2 3 5 (e.g., for three random vars.).*

- int `seedSpec`  
*the user seed specification for the random number generator (allows repeatable results)*
- int `randomSeed`  
*current seed for the random number generator*
- bool `varyPattern`  
*flag for continuing the random number or QMC sequence from a previous `run()` execution (e.g., for surrogate-based optimization) so that multiple executions are repeatable but not identical.*
- int `numCVTTrials`  
*specifies the number of sample points taken at internal CVT iteration*
- int `trialType`  
*Trial type in CVT. Specifies where the points are placed for consideration relative to the centroids. Choices are grid (2), halton (1), uniform (0), or random (-1). Default is random.*

### 43.43.1 Detailed Description

Wrapper class for the FSUDace QMC/CVT library. The `FSUDesignCompExp` class provides a wrapper for FSUDace, a C++ design of experiments library from Florida State University. This class uses quasi Monte Carlo (QMC) and Centroidal Voronoi Tesselation (CVT) methods to uniformly sample the parameter space spanned by the active bounds of the current `Model`. It returns all generated samples and their corresponding responses as well as the best sample found.

### 43.43.2 Constructor & Destructor Documentation

#### 43.43.2.1 `FSUDesignCompExp (Model & model)`

primary constructor for building a standard DACE iterator This constructor is called for a standard iterator built with data from `probDescDB`.

References Dakota::abort\_handler(), ProblemDescDB::get\_bool(), ProblemDescDB::get\_idv(), ProblemDescDB::get\_int(), ProblemDescDB::get\_string(), Iterator::maxConcurrency, Iterator::methodName, Iterator::numContinuousVars, FSUDesignCompExp::numCVTTrials, FSUDesignCompExp::numSamples, FSUDesignCompExp::primeBase, Iterator::probDescDB, FSUDesignCompExp::randomSeed, FSUDesignCompExp::seedSpec, FSUDesignCompExp::sequenceLeap, FSUDesignCompExp::sequenceStart, FSUDesignCompExp::trialType, and FSUDesignCompExp::varyPattern.

#### 43.43.2.2 `FSUDesignCompExp (Model & model, int samples, int seed, const String & sampling_method)`

alternate constructor for building a DACE iterator on-the-fly This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.

References Dakota::abort\_handler(), Iterator::maxConcurrency, Iterator::methodName, Iterator::numContinuousVars, FSUDesignCompExp::numCVTTrials, FSUDesignCompExp::numSamples, FSUDesignCompExp::primeBase, FSUDesignCompExp::randomSeed, FSUDesignCompExp::seedSpec, FSUDesignCompExp::sequenceLeap, FSUDesignCompExp::sequenceStart, and FSUDesignCompExp::trialType.

### 43.43.3 Member Function Documentation

#### 43.43.3.1 void pre\_run () [virtual]

pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all [Variables](#) (parameter sets) a priori pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [pre\\_run\(\)](#), if implemented, typically \_before\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References FSUDesignCompExp::get\_parameter\_sets(), Iterator::iteratedModel, and PStudy-DACE::varBasedDecompFlag.

#### 43.43.3.2 void post\_run (std::ostream & s) [virtual]

post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [post\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References Analyzer::allResponses, Analyzer::allSamples, SensAnalysisGlobal::compute\_correlations(), PStudyDACE::pStudyDACEsensGlobal, Iterator::subIteratorFlag, and PStudyDACE::varBasedDecompFlag.

#### 43.43.3.3 int num\_samples () const [inline, virtual]

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References FSUDesignCompExp::numSamples.

#### 43.43.3.4 void enforce\_input\_rules () [private]

enforce sanity checks/modifications for the user input specification Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References Dakota::abort\_handler(), Iterator::methodName, Iterator::numContinuousVars, FSUDesignCompExp::numSamples, and FSUDesignCompExp::primeBase.

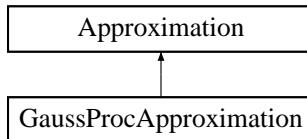

Referenced by FSUDesignCompExp::get\_parameter\_sets().

The documentation for this class was generated from the following files:

- FSUDesignCompExp.H
- FSUDesignCompExp.C

## 43.44 GaussProcApproximation Class Reference

Derived approximation class for Gaussian Process implementation. Inheritance diagram for GaussProcApproximation::

### Public Member Functions

- [GaussProcApproximation \(\)](#)  
*default constructor*
- [GaussProcApproximation \(size\\_t num\\_vars, short data\\_order\)](#)  
*alternate constructor*
- [GaussProcApproximation \(const ProblemDescDB &problem\\_db, const size\\_t &num\\_acv\)](#)  
*standard constructor*
- [~GaussProcApproximation \(\)](#)  
*destructor*

### Protected Member Functions

- int [min\\_coefficients \(\) const](#)  
*return the minimum number of samples (unknowns) required to build the derived class approximation type in num-Vars dimensions*
- int [num\\_constraints \(\) const](#)  
*return the number of constraints to be enforced via an anchor point*
- void [build \(\)](#)  
*find the covariance parameters governing the Gaussian process response*
- Real [get\\_value \(const RealVector &x\)](#)  
*retrieve the function value for a given parameter set x*
- Real [get\\_prediction\\_variance \(const RealVector &x\)](#)  
*retrieve the variance of the predicted value for a given parameter set x*
- const RealVector & [get\\_gradient \(const RealVector &x\)](#)  
*retrieve the function gradient at the predicted value for a given parameter set x*

## Private Member Functions

- void [GPmodel\\_build \(\)](#)  
*Function to compute hyperparameters governing the GP.*
- void [GPmodel\\_apply \(const RealVector &new\\_x, bool variance\\_flag, bool gradients\\_flag\)](#)  
*Function returns a response value using the GP surface.*
- void [normalize\\_training\\_data \(\)](#)  
*Normalizes the initial inputs upon which the GP surface is based.*
- void [get\\_trend \(\)](#)  
*Gets the trend (basis) functions for the calculation of the mean of the GP If the order = 0, the trend is a constant, if the order = 1, trend is linear, if order = 2, trend is quadratic.*
- void [get\\_beta\\_coefficients \(\)](#)  
*Gets the beta coefficients for the calculation of the mean of the GP.*
- int [get\\_cholesky\\_factor \(\)](#)  
*Gets the Cholesky factorization of the covariance matrix, with error checking.*
- void [get\\_process\\_variance \(\)](#)  
*Gets the estimate of the process variance given the values of beta and the correlation lengthscales.*
- void [get\\_cov\\_matrix \(\)](#)  
*calculates the covariance matrix for a given set of input points*
- void [get\\_cov\\_vector \(\)](#)  
*calculates the covariance vector between a new point x and the set of inputs upon which the GP is based*
- void [optimize\\_theta\\_global \(\)](#)  
*sets up and performs the optimization of the negative log likelihood to determine the optimal values of the covariance parameters using NCSUDirect*
- void [optimize\\_theta\\_multipoint \(\)](#)  
*sets up and performs the optimization of the negative log likelihood to determine the optimal values of the covariance parameters using a gradient-based solver and multiple starting points*
- void [predict \(bool variance\\_flag, bool gradients\\_flag\)](#)  
*Calculates the predicted new response value for x in normalized space.*
- Real [calc\\_nll \(\)](#)  
*calculates the negative log likelihood function (based on covariance matrix)*
- void [calc\\_grad\\_nll \(\)](#)  
*Gets the gradient of the negative log likelihood function with respect to the correlation lengthscales, theta.*

- void [get\\_grad\\_cov\\_vector \(\)](#)  
*Calculate the derivatives of the covariance vector, with respect to each component of  $x$ .*
- void [run\\_point\\_selection \(\)](#)  
*Runs the point selection algorithm, which will choose a subset of the training set with which to construct the GP model, and estimate the necessary parameters.*
- void [initialize\\_point\\_selection \(\)](#)  
*Initializes the point selection routine by choosing a small initial subset of the training points.*
- void [pointsel\\_get\\_errors \(RealArray &delta\)](#)  
*Uses the current GP model to compute predictions at all of the training points and find the errors.*
- int [addpoint \(int, IntArray &added\\_index\)](#)  
*Adds a point to the effective training set. Returns 1 on success.*
- int [pointsel\\_add\\_sel \(const RealArray &delta\)](#)  
*Accepts a vector of unsorted prediction errors, determines which points should be added to the effective training set, and adds them.*
- Real [maxval \(const RealArray &\) const](#)  
*Return the maximum value of the elements in a vector.*
- void [pointsel\\_write\\_points \(\)](#)  
*Writes out the training set before and after point selection.*
- void [lhodd\\_2d\\_grid\\_eval \(\)](#)  
*For problems with 2D input, evaluates the negative log likelihood on a grid.*
- void [writex \(const char\[ \]\)](#)  
*Writes out the current training set (in original units) to a specified file.*
- void [writeCovMat \(char\[ \]\)](#)  
*Writes out the covariance matrix to a specified file.*

## Static Private Member Functions

- static void [negloglik \(int mode, int n, const Teuchos::SerialDenseVector< int, double > &X, Real &fx, Teuchos::SerialDenseVector< int, double > &grad\\_x, int &result\\_mode\)](#)  
*static function used by OPT++ as the objective function to optimize the hyperparameters in the covariance of the GP by minimizing the negative log likelihood*
- static void [constraint\\_eval \(int mode, int n, const Teuchos::SerialDenseVector< int, double > &X, Teuchos::SerialDenseVector< int, double > &g, Teuchos::SerialDenseMatrix< int, double > &gradC, int &result\\_mode\)](#)

*static function used by OPT++ as the constraint function in the optimization of the negative log likelihood. Currently this function is empty: it is an unconstrained optimization.*

- static double **negloglikNCSU** (const RealVector &x)  
*function used by NCSUOptimizer to optimize negloglik objective*

## Private Attributes

- Real **approxValue**  
*value of the approximation returned by get\_value()*
- Real **approxVariance**  
*value of the approximation returned by get\_prediction\_variance()*
- RealMatrix **trainPoints**  
*A 2-D array (num sample sites = rows, num vars = columns) used to create the Gaussian process.*
- RealMatrix **trainValues**  
*An array of response values; one response value per sample site.*
- RealVector **trainMeans**  
*The mean of the input columns of trainPoints.*
- RealVector **trainStdvs**  
*The standard deviation of the input columns of trainPoints.*
- RealMatrix **normTrainPoints**  
*Current working set of normalized points upon which the GP is based.*
- RealMatrix **trendFunction**  
*matrix to hold the trend function*
- RealMatrix **betaCoeffs**  
*matrix to hold the beta coefficients for the trend function*
- RealSymMatrix **covMatrix**  
*The covariance matrix where each element (i,j) is the covariance between points Xi and Xj in the initial set of samples.*
- RealMatrix **covVector**  
*The covariance vector where each element (j,0) is the covariance between a new point X and point Xj from the initial set of samples.*
- RealMatrix **approxPoint**  
*Point at which a prediction is requested. This is currently a single point, but it could be generalized to be a vector of points.*

- RealMatrix [gradNegLogLikTheta](#)  
*matrix to hold the gradient of the negative log likelihood with respect to the theta correlation terms*
- Teuchos::SerialSpdDenseSolver< int, Real > [covSlvr](#)  
*The global solver for all computations involving the inverse of the covariance matrix.*
- RealMatrix [gradCovVector](#)  
*A matrix, where each column is the derivative of the covVector with respect to a particular component of X.*
- RealMatrix [normTrainPointsAll](#)  
*Set of all original samples available.*
- RealMatrix [trainValuesAll](#)  
*All original samples available.*
- RealMatrix [trendFunctionAll](#)  
*Trend function values corresponding to all original samples.*
- RealMatrix [Rinv\\_YFb](#)  
*Matrix for storing inverse of correlation matrix Rinv\*(Y-FB).*
- size\_t [numObs](#)  
*The number of observations on which the GP surface is built.*
- size\_t [numObsAll](#)  
*The original number of observations.*
- short [trendOrder](#)  
*The number of variables in each X variable (number of dimensions of the problem).*
- RealVector [thetaParams](#)  
*Theta is the vector of covariance parameters for the GP. We determine the values of theta by optimization. Currently, the covariance function is theta[0]\*exp(-0.5\*sume)+delta\*pow(sige,2). sume is the sum squared of weighted distances; it involves a sum of theta[1](Xi(1)-Xj(1))^2 + theta[2](Xi(2)-Xj(2))^2 + ... where Xi(1) is the first dimension value of multi-dimensional variable Xi. delta\*pow(sige,2) is a jitter term used to improve matrix computations. delta is zero for the covariance between different points and 1 for the covariance between the same point. sige is the underlying process error.*
- Real [procVar](#)  
*The process variance, the multiplier of the correlation matrix.*
- IntArray [pointsAddedIndex](#)  
*Used by the point selection algorithm, this vector keeps track all points which have been added.*
- int [cholFlag](#)  
*A global indicator for success of the Cholesky factorization.*

- bool `usePointSelection`  
*a flag to indicate the use of point selection*

## Static Private Attributes

- static `GaussProcApproximation * GPinstance`  
*pointer to the active object instance used within the static evaluator*

### 43.44.1 Detailed Description

Derived approximation class for Gaussian Process implementation. The `GaussProcApproximation` class provides a global approximation (surrogate) based on a Gaussian process. The Gaussian process is built after normalizing the function values, with zero mean. Opt++ is used to determine the optimal values of the covariance parameters, those which minimize the negative log likelihood function.

### 43.44.2 Constructor & Destructor Documentation

#### 43.44.2.1 `GaussProcApproximation () [inline]`

default constructor alternate constructor used by `EffGlobalOptimization` and `NonDGlobalReliability` that does not use a problem database defaults here are no point selectinn and quadratic trend function.

### 43.44.3 Member Function Documentation

#### 43.44.3.1 `void GPmodel_apply (const RealVector & new_x, bool variance_flag, bool gradients_flag) [private]`

Function returns a response value using the GP surface. The response value is computed at the design point specified by the `RealVector` function argument.

References `Dakota::abort_handler()`, `GaussProcApproximation::approxPoint`, `GaussProcApproximation::get_cov_vector()`, `Approximation::numVars`, `GaussProcApproximation::predict()`, `GaussProcApproximation::trainMeans`, and `GaussProcApproximation::trainStdvs`.

Referenced by `GaussProcApproximation::get_gradient()`, `GaussProcApproximation::get_prediction_variance()`, `GaussProcApproximation::get_value()`, and `GaussProcApproximation::pointsel_get_errors()`.

### 43.44.4 Member Data Documentation

#### 43.44.4.1 `short trendOrder [private]`

The number of variables in each X variable (number of dimensions of the problem). The order of the basis function for the mean of the GP If the order = 0, the trend is a constant, if the order = 1, trend is linear, if order =

2, trend is quadratic.

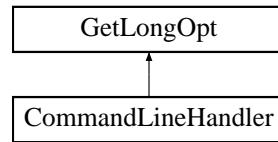

Referenced by GaussProcApproximation::GaussProcApproximation(), GaussProcApproximation::get\_beta\_coefficients(), GaussProcApproximation::get\_trend(), GaussProcApproximation::GPmodel\_build(), and GaussProcApproximation::predict().

The documentation for this class was generated from the following files:

- GaussProcApproximation.H
- GaussProcApproximation.C

## 43.45 GetLongOpt Class Reference

[GetLongOpt](#) is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France). Inheritance diagram for GetLongOpt::

### Public Types

- enum [OptType](#) { [Valueless](#), [OptionalValue](#), [MandatoryValue](#) }
- enum for different types of values associated with command line options.*

### Public Member Functions

- [GetLongOpt](#) (const char optmark= '-')

*Constructor.*
- [~GetLongOpt](#) ()

*Destructor.*
- int [parse](#) (int argc, char \*const \*argv)

*parse the command line args (argc, argv).*
- int [parse](#) (char \*const str, char \*const p)

*parse a string of options (typically given from the environment).*
- int [enroll](#) (const char \*const opt, const [OptType](#) t, const char \*const desc, const char \*const val)

*Add an option to the list of valid command options.*
- const char \* [retrieve](#) (const char \*const opt) const

*Retrieve value of option.*
- void [usage](#) (std::ostream &outfile=Cout) const

*Print usage information to outfile.*
- void [usage](#) (const char \*str)

*Change header of usage output to str.*
- void [store](#) (const char \*name, const char \*value)

*Store a specified option value.*

## Private Member Functions

- `char * basename (char *const p) const`  
*extract the base name from a string as delimited by '/'*
- `int setcell (Cell *c, char *valtoken, char *nexttoken, const char *p)`  
*internal convenience function for setting Cell::value*

## Private Attributes

- `Cell * table`  
*option table*
- `const char * ustring`  
*usage message*
- `char * pname`  
*program basename*
- `char optmarker`  
*option marker*
- `int enroll_done`  
*finished enrolling*
- `Cell * last`  
*last entry in option table*

### 43.45.1 Detailed Description

`GetLongOpt` is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France). `GetLongOpt` manages the definition and parsing of "long options." Command line options can be abbreviated as long as there is no ambiguity. If an option requires a value, the value should be separated from the option either by whitespace or an "=".

### 43.45.2 Member Enumeration Documentation

#### 43.45.2.1 enum OptType

enum for different types of values associated with command line options.

##### Enumerator:

`Valueless` option that may never have a value

*OptionalValue* option with optional value

*MandatoryValue* option with required value

### 43.45.3 Constructor & Destructor Documentation

#### 43.45.3.1 GetLongOpt (const char *optmark* = ' - ')

Constructor. Constructor for [GetLongOpt](#) takes an optional argument: the option marker. If unspecified, this defaults to ' - ', the standard (?) Unix option marker.

References [GetLongOpt::enroll\\_done](#), [GetLongOpt::last](#), [GetLongOpt::optmarker](#), [GetLongOpt::table](#), and [GetLongOpt::ustring](#).

### 43.45.4 Member Function Documentation

#### 43.45.4.1 int parse (int *argc*, char \*const \* *argv*)

parse the command line args (*argc*, *argv*). A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. *parse* returns the the optind (see getopt(3)) if parsing is successful.

References [GetLongOpt::basename\(\)](#), [GetLongOpt::enroll\\_done](#), [GetLongOpt::optmarker](#), [GetLongOpt::pname](#), [GetLongOpt::setcell\(\)](#), and [GetLongOpt::table](#).

Referenced by [CommandLineHandler::check\\_usage\(\)](#).

#### 43.45.4.2 int parse (char \*const *str*, char \*const *p*)

parse a string of options (typically given from the environment). A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. *parse* takes two strings: the first one is the string to be parsed and the second one is a string to be prefixed to the parse errors.

References [GetLongOpt::enroll\\_done](#), [GetLongOpt::optmarker](#), [GetLongOpt::setcell\(\)](#), and [GetLongOpt::table](#).

#### 43.45.4.3 int enroll (const char \*const *opt*, const OptType *t*, const char \*const *desc*, const char \*const *val*)

Add an option to the list of valid command options. *enroll* adds option specifications to its internal database. The first argument is the option sting. The second is an enum saying if the option is a flag (Valueless), if it requires a mandatory value (MandatoryValue) or if it takes an optional value (OptionalValue). The third argument is a string giving a brief description of the option. This description will be used by [GetLongOpt::usage](#). [GetLongOpt](#), for usage-printing, uses {\$val} to represent values needed by the options. {< \$val>="">} is a mandatory value and {[ \$val]} is an optional value. The final argument to *enroll* is the default string to be returned if the option is not specified. For flags (options with Valueless), use "" (empty string, or in fact any arbitrary string) for specifying TRUE and 0 (null pointer) to specify FALSE.

References [GetLongOpt::enroll\\_done](#), [GetLongOpt::last](#), and [GetLongOpt::table](#).

Referenced by [CommandLineHandler::initialize\\_options\(\)](#).

#### 43.45.4.4 const char \* retrieve (const char \*const *opt*) const

Retrieve value of option. The values of the options that are enrolled in the database can be retrieved using retrieve. This returns a string and this string should be converted to whatever type you want. See atoi, atof, atol, etc. If a "parse" is not done before retrieving all you will get are the default values you gave while enrolling! Ambiguities while retrieving (may happen when options are abbreviated) are resolved by taking the matching option that was enrolled last. For example, -{v} will expand to {-verify}. If you try to retrieve something you didn't enroll, you will get a warning message.

References GetLongOpt::optmarker, and GetLongOpt::table.

Referenced by CommandLineHandler::check\_usage(), CommandLineHandler::instantiate\_flag(), main(), ProblemDescDB::manage\_inputs(), ParallelLibrary::manage\_run\_modes(), CommandLineHandler::read\_restart\_evals(), and ParallelLibrary::specify\_outputs\_restart().

#### 43.45.4.5 void usage (const char \* str) [inline]

Change header of usage output to str. [GetLongOpt::usage](#) is overloaded. If passed a string "str", it sets the internal usage string to "str". Otherwise it simply prints the command usage.

References GetLongOpt::ustring.

The documentation for this class was generated from the following files:

- CommandLineHandler.H
- CommandLineHandler.C

## 43.46 Graphics Class Reference

The [Graphics](#) class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics as well as tabular cataloguing of data for post-processing with Matlab, Tecplot, etc.

### Public Member Functions

- [`Graphics \(\)`](#)  
*constructor*
- [`~Graphics \(\)`](#)  
*destructor*

- std::string [tabularCntrLabel](#)  
*label for counter used in first line comment w/i the tabular data file*
- std::ofstream [tabularDataStream](#)  
*file stream for tabulation of graphics data within compute\_response*

### 43.46.1 Detailed Description

The [Graphics](#) class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics as well as tabular cataloguing of data for post-processing with Matlab, Tecplot, etc. There is only one [Graphics](#) object (dakotaGraphics) and it is global (for convenient access from strategies, models, and approximations).

### 43.46.2 Member Function Documentation

#### 43.46.2.1 void [create\\_plots\\_2d \(const Variables & vars, const Response & response\)](#)

creates the 2d graphics window and initializes the plots Sets up a single event loop for duration of the dakota-Graphics object, continuously adding data to a single window. There is no reset. To start over with a new data set, you need a new object (delete old and instantiate new).

References Variables::continuous\_variable\_labels(), Variables::cv(), Variables::discrete\_int\_variable\_labels(), Variables::discrete\_real\_variable\_labels(), Variables::div(), Variables::drv(), Response::function\_labels(), Graphics::graphics2D, Response::num\_functions(), Dakota::re\_match(), and Graphics::win2dOn.

Referenced by SurrBasedMinimizer::initialize\_graphics(), NonDReliability::initialize\_graphics(), and Iterator::initialize\_graphics().

#### **43.46.2.2 void create\_tabular\_datastream (const Variables & vars, const Response & response, const std::string & tabular\_data\_file)**

opens the tabular data file stream and prints the headings Opens the tabular data file stream and prints headings, one for each continuous and discrete variable and one for each response function, using the variable and response function labels. This tabular data is used for post-processing of DAKOTA results in Matlab, Tecplot, etc.

References Graphics::tabularCntrLabel, Graphics::tabularDataFlag, and Graphics::tabularDataStream.

Referenced by SurrBasedMinimizer::initialize\_graphics(), and Iterator::initialize\_graphics().

#### **43.46.2.3 void add\_datapoint (const Variables & vars, const Response & response)**

adds data to each window in the 2d graphics and adds a row to the tabular data file based on the results of a model evaluation Adds data to each 2d plot and each tabular data column (one for each active variable and for each response function). graphicsCntr is used for the x axis in the graphics and the first column in the tabular data.

References Response::active\_set\_request\_vector(), Variables::continuous\_variables(), Variables::discrete\_int\_variables(), Variables::discrete\_real\_variables(), Response::function\_values(), Graphics::graphics2D, Graphics::graphicsCntr, Graphics::tabularDataFlag, Graphics::tabularDataStream, Graphics::win2dOn, and Dakota::write\_data\_tabular().

Referenced by Model::compute\_response(), NonDLocalReliability::mean\_value(), SurrBasedLocalMinimizer::minimize\_surrogates(), Model::synchronize(), Model::synchronize\_nowait(), and NonDLocalReliability::update\_level\_data().

#### **43.46.2.4 void add\_datapoint (int i, double x, double y)**

adds data to a single window in the 2d graphics Adds data to a single 2d plot. Allows complete flexibility in defining other kinds of x-y plotting in the 2D graphics.

References Graphics::graphics2D, and Graphics::win2dOn.

#### **43.46.2.5 void new\_dataset (int i)**

creates a separate line graphic for subsequent data points for a single window in the 2d graphics Used for displaying multiple data sets within the same plot.

References Graphics::graphics2D, and Graphics::win2dOn.

Referenced by NonDLocalReliability::update\_level\_data().

## 43.47 GridApplicInterface Class Reference

Derived application interface class which spawns simulation codes using grid services such as Condor or Globus.  
Inheritance diagram for GridApplicInterface::

### Public Member Functions

- `GridApplicInterface (const ProblemDescDB &problem_db)`  
*constructor*
- `~GridApplicInterface ()`  
*destructor*
- `void derived_map (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)`  
*Called by `map()` and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*
- `void derived_map_asynch (const ParamResponsePair &pair)`  
*Called by `map()` and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*
- `void derived_synch (PRPQueue &prp_queue)`  
*For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.*
- `void derived_synch_nowait (PRPQueue &prp_queue)`  
*For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.*
- `int derived_synchronous_local_analysis (const int &analysis_id)`
- `const StringArray & analysis_drivers () const`  
*retrieve the analysis drivers specification for application interfaces*
- `const AnalysisCode * analysis_code () const`  
*return `AnalysisCode::fileNameMap` when defined for derived `Interface` class*

## Public Attributes

- [SysCallAnalysisCode code](#)

*Used to read/write parameter files and responses.*

## Protected Member Functions

- void [derived\\_synch\\_kernel](#) (PRPQueue &prp\_queue)  
*Convenience function for common code between derived\_synch() & derived\_synch\_nowait().*
- bool [grid\\_file\\_test](#) (const String &root\_file)  
*test file(s) for existence based on root\_file name*

## Protected Attributes

- IntSet [idSet](#)  
*Set of function evaluation id's for active asynchronous system call evaluations.*
- IntShortMap [failCountMap](#)  
*map linking function evaluation id's to number of response read failures*
- [start\\_grid\\_computing\\_t start\\_grid\\_computing](#)  
*handle to dynamically linked start\_grid\_computing function*
- [perform\\_analysis\\_t perform\\_analysis](#)  
*handle to dynamically linked perform\_analysis grid function*
- [get\\_jobs\\_completed\\_t get\\_jobs\\_completed](#)  
*handle to dynamically linked get\_jobs\_completed grid function*
- [stop\\_grid\\_computing\\_t stop\\_grid\\_computing](#)  
*handle to dynamically linked stop\_grid\_computing function*

### 43.47.1 Detailed Description

Derived application interface class which spawns simulation codes using grid services such as Condor or Globus. This class is currently a modified copy of [SysCallApplicInterface](#) adapted for use with an external grid services library which was dynamically linked using dlopen() services.

### 43.47.2 Member Function Documentation

#### 43.47.2.1 int derived\_synchronous\_local\_analysis (const int & analysis\_id) [inline, virtual]

This code provides the derived function used by [ApplicationInterface::serve\\_analyses\\_synch\(\)](#).

TODO - allow local analyses?????

Reimplemented from [ApplicationInterface](#).

References [GridApplicInterface::code](#), and [SysCallAnalysisCode::spawn\\_analysis\(\)](#).

#### 43.47.2.2 void derived\_synch\_kernel (PRPQueue & prp\_queue) [protected]

Convenience function for common code between [derived\\_synch\(\)](#) & [derived\\_synch\\_nowait\(\)](#). Convenience function for common code between wait and nowait case.

References [Dakota::abort\\_handler\(\)](#), [Response::active\\_set\(\)](#), [GridApplicInterface::code](#), [ApplicationInterface::completionSet](#), [GridApplicInterface::failCountMap](#), [GridApplicInterface::grid\\_file\\_test\(\)](#), [GridApplicInterface::idSet](#), [Dakota::lookup\\_by\\_eval\\_id\(\)](#), [ApplicationInterface::manage\\_failure\(\)](#), [ParamResponsePair::prp\\_parameters\(\)](#), [ParamResponsePair::prp\\_response\(\)](#), [AnalysisCode::read\\_results\\_files\(\)](#), and [AnalysisCode::results\\_filename\(\)](#).

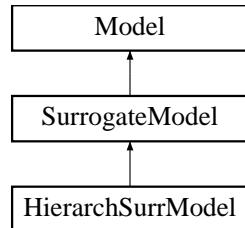

Referenced by [GridApplicInterface::derived\\_synch\(\)](#), and [GridApplicInterface::derived\\_synch\\_nowait\(\)](#).

*map of high-fidelity responses retrieved in [derived\\_synchronize\\_nowait\(\)](#) that could not be returned since corresponding low-fidelity response portions were still pending.*
- Model `lowFidelityModel`  
*provides approximate low fidelity function evaluations. [Model](#) is of arbitrary type and supports recursions (e.g., lowFidelityModel can be a data fit surrogate on a low fidelity model).*
- Model `highFidelityModel`  
*provides truth evaluations for computing corrections to the low fidelity results. [Model](#) is of arbitrary type and supports recursions.*
- Response `highFidRefResponse`  
*the reference high fidelity response computed in [build\\_approximation\(\)](#) and used for calculating corrections.*

### 43.48.1 Detailed Description

Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity). The [HierarchSurrModel](#) class manages hierarchical models of varying fidelity. In particular, it uses a low fidelity model as a surrogate for a high fidelity model. The class contains a lowFidelityModel which performs the approximate low fidelity function evaluations and a highFidelityModel which provides truth evaluations for computing corrections to the low fidelity results.

## 43.48.2 Member Function Documentation

### 43.48.2.1 void derived\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [compute\\_response\(\)](#) specific to [HierarchSurrModel](#) Compute the response synchronously using lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, compute the high fidelity response if needed with [build\\_approximation\(\)](#), and, if correction is active, correct the low fidelity results.

Reimplemented from [Model](#).

References Response::active\_set(), DiscrepancyCorrection::apply(), SurrogateModel::approxBuilds, SurrogateModel::asv\_mapping(), HierarchSurrModel::build\_approximation(), HierarchSurrModel::component\_parallel\_mode(), DiscrepancyCorrection::compute(), Model::compute\_response(), DiscrepancyCorrection::computed(), Variables::continuous\_variables(), Response::copy(), Model::current\_response(), Model::currentResponse, Model::currentVariables, SurrogateModel::deltaCorr, SurrogateModel::force\_rebuild(), HierarchSurrModel::hierModelEvalCntr, HierarchSurrModel::highFidelityModel, HierarchSurrModel::highFidRefResponse, HierarchSurrModel::lowFidelityModel, Model::outputLevel, ActiveSet::request\_vector(), SurrogateModel::response\_mapping(), SurrogateModel::responseMode, Response::update(), and HierarchSurrModel::update\_model().

### 43.48.2.2 void derived\_asynch\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [asynch\\_compute\\_response\(\)](#) specific to [HierarchSurrModel](#) Compute the response asynchronously using lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, compute the high fidelity response with [build\\_approximation\(\)](#) (for correcting the low fidelity results in [derived\\_synchronize\(\)](#) and [derived\\_synchronize\\_nowait\(\)](#)) if not performed previously.

Reimplemented from [Model](#).

References SurrogateModel::approxBuilds, SurrogateModel::asv\_mapping(), Model::asynch\_compute\_response(), HierarchSurrModel::build\_approximation(), Variables::continuous\_variables(), Dakota::copy\_data(), Model::currentVariables, Model::evaluation\_id(), SurrogateModel::force\_rebuild(), HierarchSurrModel::hierModelEvalCntr, HierarchSurrModel::highFidelityModel, HierarchSurrModel::lowFidelityModel, SurrogateModel::rawCVarsMap, ActiveSet::request\_vector(), SurrogateModel::responseMode, SurrogateModel::surrIdMap, SurrogateModel::truthIdMap, and HierarchSurrModel::update\_model().

### 43.48.2.3 const IntResponseMap & derived\_synchronize () [protected, virtual]

portion of [synchronize\(\)](#) specific to [HierarchSurrModel](#) Blocking retrieval of asynchronous evaluations from lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, apply correction (if active) to each response in the array. [derived\\_synchronize\(\)](#) is designed for the general case where [derived\\_asynch\\_compute\\_response\(\)](#) may be inconsistent in its use of low fidelity evaluations, high fidelity evaluations, or both.

Reimplemented from [Model](#).

References DiscrepancyCorrection::apply(), SurrogateModel::cachedApproxRespMap, HierarchSurrModel::cachedTruthRespMap, HierarchSurrModel::component\_parallel\_mode(), DiscrepancyCorrection::compute(), DiscrepancyCorrection::computed(), SurrogateModel::deltaCorr, HierarchSurrModel::highFidelityModel, HierarchSurrModel::highFidRefResponse, HierarchSurrModel::lowFidelityModel, Model::outputLevel, SurrogateModel::rawCVarsMap, SurrogateModel::response\_mapping(), Surrogate-

Model::responseMode, SurrogateModel::surrIdMap, SurrogateModel::surrResponseMap, Model::synchronize(), and SurrogateModel::truthIdMap.

#### 43.48.2.4 const IntResponseMap & derived\_synchronize\_nowait () [protected, virtual]

portion of [synchronize\\_nowait\(\)](#) specific to [HierarchSurrModel](#). Nonblocking retrieval of asynchronous evaluations from lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, apply correction (if active) to each response in the map. [derived\\_synchronize\\_nowait\(\)](#) is designed for the general case where [derived\\_asynch\\_compute\\_response\(\)](#) may be inconsistent in its use of actual evals, approx evals, or both.

Reimplemented from [Model](#).

References DiscrepancyCorrection::apply(), SurrogateModel::cachedApproxRespMap, HierarchSur-  
rModel::cachedTruthRespMap, HierarchSurrModel::component\_parallel\_mode(), DiscrepancyCor-  
rection::compute(), DiscrepancyCorrection::computed(), SurrogateModel::deltaCorr, HierarchSur-  
rModel::highFidelityModel, HierarchSurrModel::highFidRefResponse, HierarchSurrModel::lowFidelityModel,  
Model::outputLevel, SurrogateModel::rawCVarsMap, SurrogateModel::response\_mapping(), Surrogate-  
Model::responseMode, SurrogateModel::surrIdMap, SurrogateModel::surrResponseMap, Model::synchronize\_-  
nowait(), and SurrogateModel::truthIdMap.

#### 43.48.2.5 int evaluation\_id () const [inline, protected, virtual]

Return the current evaluation id for the [HierarchSurrModel](#). return the hierarchical model evaluation count. Due to possibly intermittent use of surrogate bypass, this is not the same as either the loFi or hiFi model evaluation counts. It also does not distinguish duplicate evals.

Reimplemented from [Model](#).

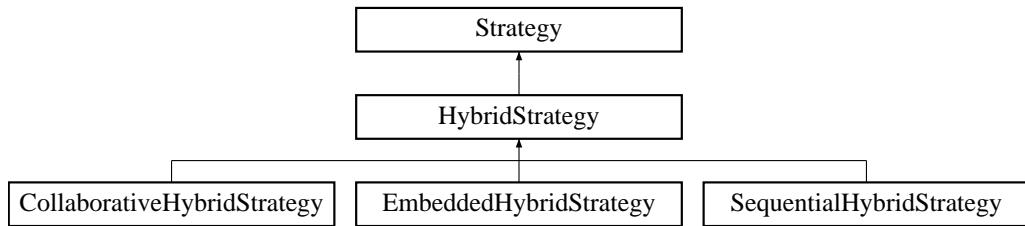

References HierarchSurrModel::hierModelEvalCntr.

### 43.50.1 Detailed Description

Base class for the interface class hierarchy. The [Interface](#) class hierarchy provides the part of a [Model](#) that is responsible for mapping a set of [Variables](#) into a set of Responses. The mapping is performed using either a simulation-based application interface or a surrogate-based approximation interface. For memory efficiency and enhanced polymorphism, the interface hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Interface](#)) serves as the envelope and one of the derived classes (selected in [Interface::get\\_interface\(\)](#)) serves as the letter.

### 43.50.2 Constructor & Destructor Documentation

#### 43.50.2.1 Interface ()

default constructor used in [Model](#) envelope class instantiations

#### 43.50.2.2 Interface ([ProblemDescDB](#) & *problem\_db*)

standard constructor for envelope Used in [Model](#) instantiation to build the envelope. This constructor only needs to extract enough data to properly execute [get\\_interface](#), since [Interface::Interface\(BaseConstructor, problem\\_db\)](#) builds the actual base class data inherited by the derived interfaces.

References [Dakota::abort\\_handler\(\)](#), [Interface::get\\_interface\(\)](#), and [Interface::interfaceRep](#).

#### 43.50.2.3 Interface (`const Interface & interface`)

copy constructor Copy constructor manages sharing of interfaceRep and incrementing of referenceCount.  
References Interface::interfaceRep, and Interface::referenceCount.

#### 43.50.2.4 ~Interface () [virtual]

destructor Destructor decrements referenceCount and only deletes interfaceRep if referenceCount is zero.  
References Interface::interfaceRep, and Interface::referenceCount.

#### 43.50.2.5 Interface (`BaseConstructor, const ProblemDescDB & problem_db`) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all inherited interfaces. [get\\_interface\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_interface\(\)](#) again). Since this is the letter and the letter IS the representation, interfaceRep is set to NULL (an uninitialized pointer causes problems in ~Interface).

References Dakota::abort\_handler(), Interface::algebraic\_function\_type(), Interface::algebraicConstraintWeights, Interface::algebraicFnTags, Interface::algebraicFnTypes, Interface::algebraicMappings, Interface::algebraicVarTags, Interface::asl, Interface::coreMappings, String::data(), String::ends(), Interface::fineGrainEvalCounters, Interface::fnLabels, ProblemDescDB::get\_dsa(), ProblemDescDB::get\_string(), Interface::init\_evaluation\_counters(), and Interface::outputLevel.

### 43.50.3 Member Function Documentation

#### 43.50.3.1 Interface operator= (`const Interface & interface`)

assignment operator Assignment operator decrements referenceCount for old interfaceRep, assigns new interfaceRep, and increments referenceCount for new interfaceRep.

References Interface::interfaceRep, and Interface::referenceCount.

#### 43.50.3.2 void assign\_rep (`Interface * interface_rep, bool ref_count_incr = true`)

replaces existing letter with a new one Similar to the assignment operator, the [assign\\_rep\(\)](#) function decrements referenceCount for the old interfaceRep and assigns the new interfaceRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign\_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref\_count\_incr:

- `ref_count_incr = true` (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.
- `ref_count_incr = false`: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after [get\\_interface\(\)](#): a letter is dynamically allocated using new and passed into assign\_rep, the

letter's reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

References Dakota::abort\_handler(), Interface::interfaceRep, and Interface::referenceCount.

Referenced by DataFitSurrModel::DataFitSurrModel(), model\_interface\_plugins(), and run\_dakota().

#### 43.50.3.3 Interface \* get\_interface (ProblemDescDB & problem\_db) [private]

Used by the envelope to instantiate the correct letter class. used only by the envelope constructor to initialize interfaceRep to the appropriate derived type.

References ProblemDescDB::get\_string().

Referenced by Interface::Interface().

### 43.50.4 Member Data Documentation

#### 43.50.4.1 IntResponseMap rawResponseMap [protected]

Set of responses returned after either a blocking or nonblocking schedule of asynchronous evaluations. The map is a full/partial set of completions which are identified through their evalIdCntr key. The raw set is postprocessed (i.e., finite diff grads merged) in [Model::synchronize\(\)](#) where it becomes responseMap.

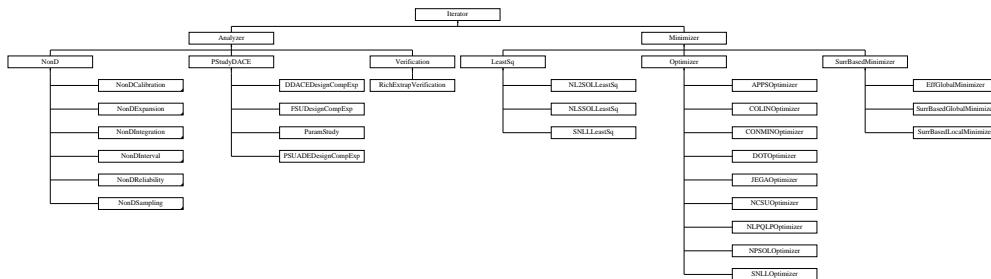

Referenced by ApplicationInterface::asynchronous\_local\_evaluations(), ApplicationInterface::asynchronous\_local\_evaluations\_nowait(), ApplicationInterface::asynchronous\_local\_evaluations\_static(), ApplicationInterface::self\_schedule\_evaluations(), ApplicationInterface::static\_schedule\_evaluations(), ApproximationInterface::synch(), ApplicationInterface::synch(), ApproximationInterface::synch\_nowait(), ApplicationInterface::synch\_nowait(), and ApplicationInterface::synchronous\_local\_evaluations().

The documentation for this class was generated from the following files:

- DakotaInterface.H
- DakotaInterface.C

## 43.51 Iterator Class Reference

Base class for the iterator class hierarchy. Inheritance diagram for Iterator::

### Public Member Functions

- **Iterator ()**  
*default constructor*
- **Iterator (Model &model)**  
*standard envelope constructor*
- **Iterator (const String &method\_name, Model &model)**  
*alternate envelope constructor for instantiations by name*
- **Iterator (const Iterator &iterator)**  
*copy constructor*
- virtual ~Iterator ()  
*destructor*
- **Iterator operator= (const Iterator &iterator)**  
*assignment operator*
- virtual void **initialize\_run ()**  
*utility function to perform common operations prior to `pre_run()`; typically memory initialization; setting of instance pointers*
- virtual void **pre\_run ()**  
*pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all **Variables** (parameter sets) a priori*
- virtual void **run ()**  
*run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post*

- virtual void `post_run` (std::ostream &s)  
*post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way*
- virtual void `finalize_run` ()  
*utility function to perform common operations following `post_run()`; deallocation and resetting of instance pointers*
- virtual void `reset` ()  
*restore initial state for repeated sub-iterator executions*
- virtual const `Variables & variables_results` () const  
*return a single final iterator solution (variables)*
- virtual const `Response & response_results` () const  
*return a single final iterator solution (response)*
- virtual const `VariablesArray & variables_array_results` ()  
*return multiple final iterator solutions (variables). This should only be used if `returns_multiple_points()` returns true.*
- virtual const `ResponseArray & response_array_results` ()  
*return multiple final iterator solutions (response). This should only be used if `returns_multiple_points()` returns true.*
- virtual bool `accepts_multiple_points` () const  
*indicates if this iterator accepts multiple initial points. Default return is false. Override to return true if appropriate.*
- virtual bool `returns_multiple_points` () const  
*indicates if this iterator returns multiple final points. Default return is false. Override to return true if appropriate.*
- virtual void `initial_points` (const `VariablesArray &pts`)  
*sets the multiple initial points for this iterator. This should only be used if `accepts_multiple_points()` returns true.*
- virtual void `response_results_active_set` (const `ActiveSet &set`)  
*set the requested data for the final iterator response results*
- virtual void `initialize_graphics` (bool graph\_2d, bool tabular\_data, const `String &tabular_file`)  
*initialize the 2D graphics window and the tabular graphics data*
- virtual void `print_results` (std::ostream &s)  
*print the final iterator results*
- virtual int `num_samples` () const  
*get the current number of samples*
- virtual void `sampling_reset` (int min\_samples, bool all\_data\_flag, bool stats\_flag)

*reset sampling iterator to use at least min\_samples*

- virtual const [String & sampling\\_scheme](#) () const  
*return sampling name*
- virtual const [Model & algorithm\\_space\\_model](#) () const  
*return the result of any recasting or surrogate model recursion layered on top of iteratedModel by the derived Iterator ctor chain*
- virtual [String uses\\_method](#) () const  
*return name of any enabling iterator used by this iterator*
- virtual void [method\\_recourse](#) ()  
*perform a method switch, if possible, due to a detected conflict*
- virtual const VariablesArray & [all\\_variables](#) ()  
*return the complete set of evaluated variables*
- virtual const RealMatrix & [all\\_samples](#) ()  
*return the complete set of evaluated samples*
- virtual const IntResponseMap & [all\\_responses](#) () const  
*return the complete set of computed responses*
- virtual bool [compact\\_mode](#) () const  
*returns Analyzer::compactMode*
- void [run\\_iterator](#) (std::ostream &s)  
*orchestrate initialize/pre/run/post/finalize phases*
- void [assign\\_rep](#) (Iterator \*iterator\_rep, bool ref\_count\_incr=true)  
*replaces existing letter with a new one*
- [ProblemDescDB & problem\\_description\\_db](#) () const  
*return the problem description database (probDescDB)*
- const [String & method\\_name](#) () const  
*return the method name*
- const [String & method\\_id](#) () const  
*return the method identifier (methodId)*
- void [output\\_level](#) (short out\_lev)  
*set the method output level (outputLevel)*
- short [output\\_level](#) () const

*return the method output level (outputLevel)*

- **void summary\_output (bool summary\_output\_flag)**  
*Set summary output control; true enables evaluation/results summary.*
- **int maximum\_concurrency () const**  
*return the maximum concurrency supported by the iterator*
- **void maximum\_concurrency (int max\_conc)**  
*set the maximum concurrency supported by the iterator*
- **size\_t num\_final\_solutions () const**  
*return the number of solutions to retain in best variables/response arrays*
- **void num\_final\_solutions (size\_t num\_final)**  
*set the number of solutions to retain in best variables/response arrays*
- **void active\_set (const ActiveSet &set)**  
*set the default active set vector (for use with iterators that employ evaluate\_parameter\_sets())*
- **const ActiveSet & active\_set () const**  
*return the default active set vector (used by iterators that employ evaluate\_parameter\_sets())*
- **void sub\_iterator\_flag (bool si\_flag)**  
*set subIteratorFlag (and update summaryOutputFlag if needed)*
- **void active\_variable\_mappings (const SizetArray &c\_index1, const SizetArray &di\_index1, const SizetArray &dr\_index1, const ShortArray &c\_target2, const ShortArray &di\_target2, const ShortArray &dr\_target2)**  
*set primaryA{CV,DIV,DRV}MapIndices, secondaryA{CV,DIV,DRV}MapTargets*
- **bool is\_null () const**  
*function to check iteratorRep (does this envelope contain a letter?)*
- **Iterator \* iterator\_rep () const**  
*returns iteratorRep for access to derived class member functions that are not mapped to the top Iterator level*

## Protected Member Functions

- **Iterator (BaseConstructor, Model &model)**  
*constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)*
- **Iterator (NoDBBaseConstructor, Model &model)**  
*alternate constructor for base iterator classes constructed on the fly*

- **Iterator (NoDBBaseConstructor)**  
*alternate constructor for base iterator classes constructed on the fly*
- **virtual const VariablesArray & initial\_points () const**  
*gets the multiple initial points for this iterator. This will only be meaningful after a call to initial\_points mutator.*

## Protected Attributes

- **Model iteratedModel**  
*shallow copy of the model passed into the constructor or a thin RecastModel wrapped around it*
- **ProblemDescDB & probDescDB**  
*class member reference to the problem description database*
- **String methodName**  
*name of the iterator (the user's method spec)*
- **Real convergenceTol**  
*iteration convergence tolerance*
- **int maxIterations**  
*maximum number of iterations for the iterator*
- **int maxFunctionEvals**  
*maximum number of fn evaluations for the iterator*
- **int maxConcurrency**  
*maximum coarse-grained concurrency*
- **size\_t numFunctions**  
*number of response functions*
- **size\_t numContinuousVars**  
*number of active continuous vars*
- **size\_t numDiscreteIntVars**  
*number of active discrete integer vars*
- **size\_t numDiscreteRealVars**  
*number of active discrete real vars*
- **size\_t numFinalSolutions**  
*number of solutions to retain in best variables/response arrays*

- **ActiveSet activeSet**  
*tracks the response data requirements on each function evaluation*
- **VariablesArray bestVariablesArray**  
*collection of N best solution variables found during the study*
- **ResponseArray bestResponseArray**  
*collection of N best solution responses found during the study*
- **bool subIteratorFlag**  
*flag indicating if this [Iterator](#) is a sub-iterator ([NestedModel::subIterator](#) or [DataFitSurrModel::daceIterator](#))*
- **SizetArray primaryACVarMapIndices**  
*"primary" all continuous variable mapping indices flowed down from higher level iteration*
- **SizetArray primaryADIVarMapIndices**  
*"primary" all discrete int variable mapping indices flowed down from higher level iteration*
- **SizetArray primaryADRVarMapIndices**  
*"primary" all discrete real variable mapping indices flowed down from higher level iteration*
- **ShortArray secondaryACVarMapTargets**  
*"secondary" all continuous variable mapping targets flowed down from higher level iteration*
- **ShortArray secondaryADIVarMapTargets**  
*"secondary" all discrete int variable mapping targets flowed down from higher level iteration*
- **ShortArray secondaryADRVarMapTargets**  
*"secondary" all discrete real variable mapping targets flowed down from higher level iteration*
- **String gradientType**  
*type of gradient data: analytic, numerical, mixed, or none*
- **String methodSource**  
*source of numerical gradient routine: dakota or vendor*
- **String intervalType**  
*type of numerical gradient interval: central or forward*
- **String hessianType**  
*type of Hessian data: analytic, numerical, quasi, mixed, or none*
- **Real fdGradStepSize**  
*relative finite difference step size for numerical gradients*
- **Real fdHessByGradStepSize**

*relative finite difference step size for numerical Hessians estimated using first-order differences of gradients*

- Real **fdHessByFnStepSize**

*relative finite difference step size for numerical Hessians estimated using second-order differences of function values*

- short **outputLevel**

*output verbosity level: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}\_OUTPUT*

- bool **summaryOutputFlag**

*flag for summary output (evaluation stats, final results); default true, but false for on-the-fly (helper) iterators and sub-iterator use cases*

- bool **asynchFlag**

*copy of the model's asynchronous evaluation flag*

- int **writePrecision**

*write precision as specified by the user*

## Private Member Functions

- **Iterator \* get\_iterator (Model &model)**

*Used by the envelope to instantiate the correct letter class.*

- **Iterator \* get\_iterator (const String &method\_name, Model &model)**

*Used by the envelope to instantiate the correct letter class.*

- virtual void **pre\_output ()**

*convenience function to write variables to file, following pre-run*

- virtual void **post\_input ()**

*read tabular data for post-run mode*

## Private Attributes

- **String methodId**

*method identifier string from the input file*

- **Iterator \* iteratorRep**

*pointer to the letter (initialized only for the envelope)*

- int **referenceCount**

*number of objects sharing iteratorRep*

### 43.51.1 Detailed Description

Base class for the iterator class hierarchy. The [Iterator](#) class is the base class for one of the primary class hierarchies in DAKOTA. The iterator hierarchy contains all of the iterative algorithms which use repeated execution of simulations as function evaluations. For memory efficiency and enhanced polymorphism, the iterator hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Iterator](#)) serves as the envelope and one of the derived classes (selected in [Iterator::get\\_iterator\(\)](#)) serves as the letter.

### 43.51.2 Constructor & Destructor Documentation

#### 43.51.2.1 [Iterator \(\)](#)

default constructor The default constructor is used in `Vector<Iterator>` instantiations and for initialization of [Iterator](#) objects contained in [Strategy](#) derived classes (see derived class header files). `iteratorRep` is `NULL` in this case (a populated `problem_db` is needed to build a meaningful [Iterator](#) object). This makes it necessary to check for `NULL` pointers in the copy constructor, assignment operator, and destructor.

Referenced by `SurrBasedGlobalMinimizer::SurrBasedGlobalMinimizer()`, and `SurrBasedLocalMinimizer::SurrBasedLocalMinimizer()`.

#### 43.51.2.2 [Iterator \(Model & model\)](#)

standard envelope constructor Used in iterator instantiations within strategy constructors. Envelope constructor only needs to extract enough data to properly execute [get\\_iterator\(\)](#), since letter holds the actual base class data.

References `Dakota::abort_handler()`, `Iterator::get_iterator()`, and `Iterator::iteratorRep`.

#### 43.51.2.3 [Iterator \(const String & method\\_name, Model & model\)](#)

alternate envelope constructor for instantiations by name Used in sub-iterator instantiations within iterator constructors. Envelope constructor only needs to extract enough data to properly execute [get\\_iterator\(\)](#), since letter holds the actual base class data.

References `Dakota::abort_handler()`, `Iterator::get_iterator()`, and `Iterator::iteratorRep`.

#### 43.51.2.4 [Iterator \(const Iterator & iterator\)](#)

copy constructor Copy constructor manages sharing of `iteratorRep` and incrementing of `referenceCount`.

References `Iterator::iteratorRep`, and `Iterator::referenceCount`.

#### 43.51.2.5 [~Iterator \(\) \[virtual\]](#)

destructor Destructor decrements `referenceCount` and only deletes `iteratorRep` when `referenceCount` reaches zero.

References `Iterator::iteratorRep`, and `Iterator::referenceCount`.

**43.51.2.6 Iterator (BaseConstructor, Model & *model*) [protected]**

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor builds the base class data for all inherited iterators. [get\\_iterator\(\)](#) instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_iterator\(\)](#) again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in [~Iterator](#)).

References Dakota::abort\_handler(), Iterator::fdGradStepSize, Iterator::fdHessByFnStepSize, Iterator::fdHessByGradStepSize, ProblemDescDB::get\_dil(), ProblemDescDB::get\_rdv(), Iterator::gradientType, Iterator::hessianType, Iterator::intervalType, Iterator::methodName, Iterator::methodSource, Iterator::numContinuousVars, Iterator::numDiscreteIntVars, Iterator::numDiscreteRealVars, Iterator::numFunctions, and Iterator::probDescDB.

**43.51.2.7 Iterator (NoDBBaseConstructor, Model & *model*) [protected]**

alternate constructor for base iterator classes constructed on the fly This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used. Therefore it only sets attributes taken from the incoming model. Since there are no iterator-specific redefinitions of maxIterations or numFinalSolutions in [NoDBBaseConstructor](#) mode, go ahead and assign default value for all iterators.

**43.51.2.8 Iterator (NoDBBaseConstructor) [protected]**

alternate constructor for base iterator classes constructed on the fly This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used. It has no incoming model, so only sets up a minimal set of defaults. However, its use is preferable to the default constructor, which should remain as minimal as possible. Since there are no iterator-specific redefinitions of maxIterations or numFinalSolutions in [NoDBBaseConstructor](#) mode, go ahead and assign default value for all iterators.

**43.51.3 Member Function Documentation****43.51.3.1 Iterator operator= (const Iterator & *iterator*)**

assignment operator Assignment operator decrements referenceCount for old iteratorRep, assigns new iteratorRep, and increments referenceCount for new iteratorRep.

References Iterator::iteratorRep, and Iterator::referenceCount.

**43.51.3.2 void initialize\_run () [virtual]**

utility function to perform common operations prior to [pre\\_run\(\)](#); typically memory initialization; setting of instance pointers Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [initialize\\_run\(\)](#), typically [\\_before\\_ performing its own implementation steps](#).

Reimplemented in [CONMINOptimizer](#), [LeastSq](#), [Minimizer](#), [NonD](#), [Optimizer](#), [DOTOptimizer](#), [NLPQLPOptimizer](#), [SNLLLeastSq](#), and [SNLLOptimizer](#).

References `Model::asynch_flag()`, `Iterator::asynchFlag`, `Iterator::initialize_run()`, `Model::is_null()`, `Iterator::iteratedModel`, `Iterator::iteratorRep`, `Iterator::maxConcurrency`, `Model::set_communicators()`, `Model::set_evaluation_reference()`, and `Iterator::summaryOutputFlag`.

Referenced by `Iterator::initialize_run()`, and `Iterator::run_iterator()`.

#### **43.51.3.3 void pre\_run () [virtual]**

pre-run portion of `run_iterator` (optional); re-implemented by Iterators which can generate all [Variables](#) (parameter sets) a priori pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [pre\\_run\(\)](#), if implemented, typically \_before\_ performing its own implementation steps.

Reimplemented in [DDACEDesignCompExp](#), [FSUDesignCompExp](#), [NonDLHSSampling](#), [ParamStudy](#), and [PSUADEDesignCompExp](#).

References `Iterator::iteratorRep`, and `Iterator::pre_run()`.

Referenced by `Iterator::pre_run()`, and `Iterator::run_iterator()`.

#### **43.51.3.4 void run () [virtual]**

run portion of `run_iterator`; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented in [LeastSq](#), [NonD](#), [Optimizer](#), [PStudyDACE](#), [Verification](#), and [SurrBasedMinimizer](#).

References `Dakota::abort_handler()`, `Iterator::iteratorRep`, and `Iterator::run()`.

Referenced by `Iterator::run()`, and `Iterator::run_iterator()`.

#### **43.51.3.5 void post\_run (std::ostream & s) [virtual]**

post-run portion of `run_iterator` (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [post\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented in [COLINOptimizer](#), [LeastSq](#), [Optimizer](#), [DDACEDesignCompExp](#), [FSUDesignCompExp](#), [NonDLHSSampling](#), [ParamStudy](#), [PSUADEDesignCompExp](#), [SNLLLeastSq](#), and [SNLLOptimizer](#).

References `Model::is_null()`, `Iterator::iteratedModel`, `Iterator::iteratorRep`, `Iterator::post_run()`, `Model::print_evaluation_summary()`, `Iterator::print_results()`, and `Iterator::summaryOutputFlag`.

Referenced by `Iterator::post_run()`, and `Iterator::run_iterator()`.

**43.51.3.6 void finalize\_run() [virtual]**

utility function to perform common operations following [post\\_run\(\)](#); deallocation and resetting of instance pointers. Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [finalize\\_run\(\)](#), typically *\_after\_* performing its own implementation steps.

Reimplemented in [LeastSq](#), [Minimizer](#), [NonD](#), [Optimizer](#), [SNLLLeastSq](#), and [SNLLOptimizer](#).

References [Iterator::finalize\\_run\(\)](#), and [Iterator::iteratorRep](#).

Referenced by [Iterator::finalize\\_run\(\)](#), and [Iterator::run\\_iterator\(\)](#).

**43.51.3.7 void initialize\_graphics (bool graph\_2d, bool tabular\_data, const String & tabular\_file) [virtual]**

initialize the 2D graphics window and the tabular graphics data. This is a convenience function for encapsulating graphics initialization operations. It does not require a strategyRep forward since it is only used by letter objects.

Reimplemented in [NonDReliability](#), and [SurrBasedMinimizer](#).

References [Model::auto\\_graphics\(\)](#), [Graphics::create\\_plots\\_2d\(\)](#), [Graphics::create\\_tabular\\_datastream\(\)](#), [Model::current\\_response\(\)](#), [Model::current\\_variables\(\)](#), [Dakota::dakota\\_graphics](#), [Iterator::initialize\\_graphics\(\)](#), [Iterator::iteratedModel](#), and [Iterator::iteratorRep](#).

Referenced by [Iterator::initialize\\_graphics\(\)](#), [SequentialHybridStrategy::run\\_sequential\(\)](#), [SingleMethodStrategy::run\\_strategy\(\)](#), [EmbeddedHybridStrategy::run\\_strategy\(\)](#), [ConcurrentStrategy::run\\_strategy\(\)](#), and [CollaborativeHybridStrategy::run\\_strategy\(\)](#).

**43.51.3.8 void print\_results (std::ostream & s) [virtual]**

print the final iterator results. This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in [finalize\\_run\(\)](#).

Reimplemented in [Analyzer](#), [LeastSq](#), [Optimizer](#), [PStudyDACE](#), [Verification](#), [NonDExpansion](#), [NonDGlobalReliability](#), [NonDGPMSSABayesCalibration](#), [NonDIncremLHSSampling](#), [NonDInterval](#), [NonDLHSSampling](#), [NonDLocalReliability](#), [RichExtrapVerification](#), and [SurrBasedMinimizer](#).

References [Iterator::iteratorRep](#), and [Iterator::print\\_results\(\)](#).

Referenced by [Iterator::post\\_run\(\)](#), and [Iterator::print\\_results\(\)](#).

**43.51.3.9 int num\_samples () const [virtual]**

get the current number of samples. Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented in [DDACEDesignCompExp](#), [FSUDesignCompExp](#), [NonDCubature](#), [NonDQuadrature](#), [NonDSampling](#), [NonDSparseGrid](#), and [PSUADEDesignCompExp](#).

References [Model::derivative\\_concurrency\(\)](#), [Iterator::iteratedModel](#), [Iterator::iteratorRep](#), [Iterator::maxConcurrency](#), and [Iterator::num\\_samples\(\)](#).

Referenced by DataFitSurrModel::build\_global(), NonDGlobalReliability::get\_best\_sample(), Iterator::num\_samples(), Analyzer::samples\_to\_variables\_array(), and Analyzer::variables\_array\_to\_samples().

#### 43.51.3.10 void run\_iterator (std::ostream & s)

orchestrate initialize/pre/run/post/finalize phases. [Iterator](#) supports a construct/initialize-run/pre-run/run/post-run/finalize-run/destruct progression. This member (non-virtual) function sequences these run phases; it accepts an ostream, but controls verbosity with outputLevel

References ParallelLibrary::command\_line\_post\_run(), ParallelLibrary::command\_line\_pre\_run(), ParallelLibrary::command\_line\_run(), Iterator::finalize\_run(), Iterator::initialize\_run(), Iterator::iteratedModel, Iterator::iteratorRep, Iterator::methodName, Iterator::outputLevel, Model::parallel\_library(), Iterator::post\_input(), Iterator::post\_run(), Iterator::pre\_output(), Iterator::pre\_run(), Iterator::run(), Iterator::run\_iterator(), and Iterator::summaryOutputFlag.

#### 43.51.3.11 void assign\_rep (Iterator \* iterator\_rep, bool ref\_count\_incr = true)

replaces existing letter with a new one. Similar to the assignment operator, the [assign\\_rep\(\)](#) function decrements referenceCount for the old iteratorRep and assigns the new iteratorRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign\_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref\_count\_incr:

- ref\_count\_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.
- ref\_count\_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after [get\\_iterator\(\)](#): a letter is dynamically allocated using new and passed into assign\_rep, the letter's reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

References Dakota::abort\_handler(), Iterator::iteratorRep, and Iterator::referenceCount.

and SurrBasedLocalMinimizer::relax\_constraints().

#### 43.51.3.12 **Iterator \* get\_iterator (Model & model) [private]**

Used by the envelope to instantiate the correct letter class. Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by the methodName attribute.

References String::begins(), String::ends(), ProblemDescDB::get\_string(), Iterator::method\_name(), Iterator::methodName, and Iterator::probDescDB.

Referenced by Iterator::Iterator().

#### 43.51.3.13 **Iterator \* get\_iterator (const String & method\_name, Model & model) [private]**

Used by the envelope to instantiate the correct letter class. Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by the passed method\_name.

References String::begins().

### 43.51.4 Member Data Documentation

#### 43.51.4.1 **Real fdGradStepSize [protected]**

relative finite difference step size for numerical gradients A scalar value (instead of the vector fd\_gradient\_step\_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical gradient algorithms.

Referenced by DOTOptimizer::initialize(), CONMINOptimizer::initialize(), Iterator::Iterator(), NLSSOLLeastSq::NLSSOLLeastSq(), NPSOLOptimizer::NPSOLOptimizer(), SNLLLeastSq::SNLLLeastSq(), and SNLLOptimizer::SNLLOptimizer().

#### 43.51.4.2 **Real fdHessByGradStepSize [protected]**

relative finite difference step size for numerical Hessians estimated using first-order differences of gradients A scalar value (instead of the vector fd\_hessian\_step\_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical Hessian algorithms.

Referenced by Iterator::Iterator().

#### 43.51.4.3 **Real fdHessByFnStepSize [protected]**

relative finite difference step size for numerical Hessians estimated using second-order differences of function values A scalar value (instead of the vector fd\_hessian\_step\_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical Hessian algorithms.

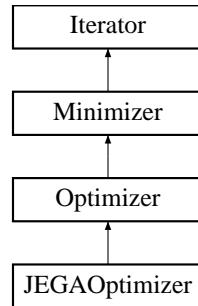

Referenced by Iterator::Iterator().

## 43.52 JEGAOptimizer Class Reference

A version of [Dakota::Optimizer](#) for instantiation of John Eddy's Genetic Algorithms (JEGA). Inheritance diagram for JEGAOptimizer::

### Classes

- class [Driver](#)  
*A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.*
- class [Evaluator](#)  
*An evaluator specialization that knows how to interact with Dakota.*
- class [EvaluatorCreator](#)  
*A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.*

### Public Member Functions

- virtual void [find\\_optimum](#) ()  
*Performs the iterations to determine the optimal set of solutions.*
- virtual bool [accepts\\_multiple\\_points](#) () const  
*Overridden to return true since JEGA algorithms can accept multiple initial points.*
- virtual bool [returns\\_multiple\\_points](#) () const  
*Overridden to return true since JEGA algorithms can return multiple final points.*
- virtual void [initial\\_points](#) (const VariablesArray &pnts)  
*Overridden to assign the \_initPnts member variable to the passed in collection of Dakota::Variables.*
- virtual const VariablesArray & [initial\\_points](#) () const  
*Overridden to return the collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.*

- [JEGAOptimizer \(Model &model\)](#)  
*Constructs a [JEGAOptimizer](#) class object.*
- [~JEGAOptimizer \(\)](#)  
*Destructs a [JEGAOptimizer](#).*

## Protected Member Functions

- void [LoadDakotaResponses](#) (const JEGA::Utilities::Design &from, Variables &vars, Response &resp)  
*const*  
*Loads the JEGA-style Design class into equivalent Dakota-style [Variables](#) and [Response](#) objects.*
- void [ReCreateTheParameterDatabase](#) ()  
*Destroys the current parameter database and creates a new empty one.*
- void [LoadTheParameterDatabase](#) ()  
*Reads information out of the known [Dakota::ProblemDescDB](#) and puts it into the current parameter database.*
- void [LoadAlgorithmConfig](#) (JEGA::FrontEnd::AlgorithmConfig &aConfig)  
*Completely initializes the supplied algorithm configuration.*
- void [LoadProblemConfig](#) (JEGA::FrontEnd::ProblemConfig &pConfig)  
*Completely initializes the supplied problem configuration.*
- void [LoadTheDesignVariables](#) (JEGA::FrontEnd::ProblemConfig &pConfig)  
*Adds [DesignVariableInfo](#) objects into the problem configuration object.*
- void [LoadTheObjectiveFunctions](#) (JEGA::FrontEnd::ProblemConfig &pConfig)  
*Adds [ObjectiveFunctionInfo](#) objects into the problem configuration object.*
- void [LoadTheConstraints](#) (JEGA::FrontEnd::ProblemConfig &pConfig)  
*Adds [ConstraintInfo](#) objects into the problem configuration object.*
- void [GetBestSolutions](#) (const JEGA::Utilities::DesignOSortSet &from, std::multimap< RealRealPair, JEGA::Utilities::Design \* > &designSortMap)  
*Returns up to [\\_numBest](#) designs sorted by DAKOTA's fitness (L2 constraint violation, then utopia or objective), taking into account the algorithm type. The front of the returned map can be viewed as a single "best".*
- void [GetBestMOSolutions](#) (const JEGA::Utilities::DesignOSortSet &from, std::multimap< RealRealPair, JEGA::Utilities::Design \* > &designSortMap)  
*Retrive the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm.*
- void [GetBestSOSolutions](#) (const JEGA::Utilities::DesignOSortSet &from, std::multimap< RealRealPair, JEGA::Utilities::Design \* > &designSortMap)  
*Retrive the best Designs from a set of solutions assuming that they are generated by a single objective algorithm.*

- JEGA::DoubleMatrix [ToDoubleMatrix](#) (const VariablesArray &variables) const  
*Converts the items in a VariablesArray into a DoubleMatrix whereby the items in the matrix are the design variables.*
- void [resize\\_variables\\_results\\_array](#) (std::size\_t newsize)  
*Safely resizes the best variables array taking into account the requirements put forth by the envelope-letter design pattern.*
- void [resize\\_response\\_results\\_array](#) (std::size\_t newsize)  
*Safely resizes the best response array taking into account the requirements put forth by the envelope-letter design pattern.*

## Private Attributes

- [EvaluatorCreator \\* \\_theEvalCreator](#)  
*A pointer to an [EvaluatorCreator](#) used to create the evaluator used by JEGA in [Dakota](#) (a JEGAEvaluator).*
- JEGA::Utilities::ParameterDatabase \* [\\_theParamDB](#)  
*A pointer to the ParameterDatabase from which all parameters are retrieved by the created algorithms.*
- VariablesArray [\\_initPts](#)  
*An array of initial points to use as an initial population.*

## Static Private Attributes

- static const std::string [SOGA\\_METHOD\\_TXT](#)  
*The text that indicates the SOGA method.*
- static const std::string [MOGA\\_METHOD\\_TXT](#)  
*The text that indicates the MOGA method.*

### 43.52.1 Detailed Description

A version of [Dakota::Optimizer](#) for instantiation of John Eddy's Genetic Algorithms (JEGA). This class encapsulates the necessary functionality for creating and properly initializing the JEGA algorithms (MOGA and SOGA).

### 43.52.2 Constructor & Destructor Documentation

#### 43.52.2.1 JEGAOptimizer (Model & model)

Constructs a [JEGAOptimizer](#) class object. This method does some of the initialization work for the algorithm. In particular, it initialized the JEGA core.

**Parameters:**

*model* The [Dakota::Model](#) that will be used by this optimizer for problem information, etc.

References JEGAOptimizer::theEvalCreator, ProblemDescDB::get\_int(), ProblemDescDB::get\_short(), Model::init\_communicators(), Iterator::iteratedModel, JEGAOptimizer::LoadTheParameterDatabase(), Optimizer::localObjectiveRecast, Iterator::maxConcurrency, Iterator::methodName, JEGAOptimizer::MOGA\_METHOD\_TXT, Iterator::numFinalSolutions, Iterator::probDescDB, and Minimizer::scaleFlag.

### 43.52.3 Member Function Documentation

#### 43.52.3.1 void LoadDakotaResponses (const JEGA::Utilities::Design & *from*, Dakota::Variables & *vars*, Dakota::Response & *resp*) const [protected]

Loads the JEGA-style Design class into equivalent Dakota-style [Variables](#) and [Response](#) objects. This version is meant for the case where a [Variables](#) and a [Response](#) object exist and just need to be loaded.

**Parameters:**

*from* The JEGA Design class object from which to extract the variable and response information for [Dakota](#).

*vars* The [Dakota::Variables](#) object into which to load the design variable values of *from*.

*resp* The [Dakota::Response](#) object into which to load the objective function and constraint values of *from*.

References Variables::continuous\_variables(), Variables::discrete\_int\_variables(), Variables::discrete\_real\_variables(), Response::function\_values(), Iterator::numContinuousVars, Iterator::numDiscreteIntVars, Iterator::numDiscreteRealVars, Iterator::numFunctions, Minimizer::numNonlinearConstraints, and Optimizer::numObjectiveFns.

Referenced by JEGAOptimizer::find\_optimum().

#### 43.52.3.2 void LoadTheParameterDatabase () [protected]

Reads information out of the known [Dakota::ProblemDescDB](#) and puts it into the current parameter database. This should be called from the [JEGAOptimizer](#) constructor since it is the only time when the problem description database is certain to be configured to supply data for this optimizer.

References JEGAOptimizer::theParamDB, ProblemDescDB::get\_bool(), ProblemDescDB::get\_int(), ProblemDescDB::get\_rdv(), ProblemDescDB::get\_real(), ProblemDescDB::get\_short(), ProblemDescDB::get\_size(), ProblemDescDB::get\_string(), Iterator::probDescDB, and JEGAOptimizer::ReCreateTheParameterDatabase().

Referenced by JEGAOptimizer::JEGAOptimizer().

#### 43.52.3.3 void LoadAlgorithmConfig (JEGA::FrontEnd::AlgorithmConfig & *aConfig*) [protected]

Completely initializes the supplied algorithm configuration. This loads the supplied configuration object with appropriate data retrieved from the parameter database.

**Parameters:**

*aConfig* The algorithm configuration object to load.

References Iterator::method\_id(), Iterator::methodName, JEGAOptimizer::MOGA\_METHOD\_TXT, and JEGAOptimizer::SOGA\_METHOD\_TXT.

Referenced by JEGAOptimizer::find\_optimum().

**43.52.3.4 void LoadProblemConfig (JEGA::FrontEnd::ProblemConfig & *pConfig*) [protected]**

Completely initializes the supplied problem configuration. This loads the fresh configuration object using the LoadTheDesignVariables, LoadTheObjectiveFunctions, and LoadTheConstraints methods.

**Parameters:**

*pConfig* The problem configuration object to load.

References JEGAOptimizer::LoadTheConstraints(), JEGAOptimizer::LoadTheDesignVariables(), and JEGAOptimizer::LoadTheObjectiveFunctions().

Referenced by JEGAOptimizer::find\_optimum().

**43.52.3.5 void LoadTheDesignVariables (JEGA::FrontEnd::ProblemConfig & *pConfig*) [protected]**

Adds DesignVariableInfo objects into the problem configuration object. This retrieves design variable information from the ParameterDatabase and creates DesignVariableInfo's from it.

**Parameters:**

*pConfig* The problem configuration object to load.

References Iterator::iteratedModel, Iterator::numContinuousVars, and Iterator::numDiscreteIntVars.

Referenced by JEGAOptimizer::LoadProblemConfig().

**43.52.3.6 void LoadTheObjectiveFunctions (JEGA::FrontEnd::ProblemConfig & *pConfig*) [protected]**

Adds ObjectiveFunctionInfo objects into the problem configuration object. This retrieves objective function information from the ParameterDatabase and creates ObjectiveFunctionInfo's from it.

**Parameters:**

*pConfig* The problem configuration object to load.

References Dakota::asstring(), and Optimizer::numObjectiveFns.

Referenced by JEGAOptimizer::LoadProblemConfig().

### 43.52.3.7 void LoadTheConstraints (JEGA::FrontEnd::ProblemConfig & *pConfig*) [protected]

Adds ConstraintInfo objects into the problem configuration object. This retrieves constraint function information from the ParameterDatabase and creates ConstraintInfo's from it.

**Parameters:**

*pConfig* The problem configuration object to load.

References Dakota::asstring(), Dakota::copy\_row\_vector(), Iterator::iteratedModel, Minimizer::numLinearEqConstraints, Minimizer::numLinearIneqConstraints, Minimizer::numNonlinearEqConstraints, and Minimizer::numNonlinearIneqConstraints.

Referenced by JEGAOptimizer::LoadProblemConfig().

### 43.52.3.8 void GetBestSolutions (const JEGA::Utilities::DesignOSortSet & *from*, std::multimap<RealRealPair, JEGA::Utilities::Design \* > & *designSortMap*) [protected]

Returns up to \_numBest designs sorted by DAKOTA's fitness (L2 constraint violation, then utopia or objective), taking into account the algorithm type. The front of the returned map can be viewed as a single "best".

**Parameters:**

*from* The full set of designs returned by the solver.

*designSortMap* Map of best solutions with key pair<constraintViolation, fitness>

eventually this functionality must be moved into a separate post-processing application for MO datasets.

References JEGAOptimizer::GetBestMOSolutions(), JEGAOptimizer::GetBestSOSolutions(), Iterator::methodName, JEGAOptimizer::MOGA\_METHOD\_TXT, and JEGAOptimizer::SOGA\_METHOD\_TXT.

Referenced by JEGAOptimizer::find\_optimum().

### 43.52.3.9 void GetBestMOSolutions (const JEGA::Utilities::DesignOSortSet & *from*, std::multimap<RealRealPair, JEGA::Utilities::Design \* > & *designSortMap*) [protected]

Retrive the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm. eventually this functionality must be moved into a separate post-processing application for MO datasets.

References Iterator::numFinalSolutions.

Referenced by JEGAOptimizer::GetBestSolutions().

### 43.52.3.10 void GetBestSOSolutions (const JEGA::Utilities::DesignOSortSet & *from*, std::multimap<RealRealPair, JEGA::Utilities::Design \* > & *designSortMap*) [protected]

Retrive the best Designs from a set of solutions assuming that they are generated by a single objective algorithm. eventually this functionality must be moved into a separate post-processing application for MO datasets.

References JEGAOptimizer::\_theParamDB, and Iterator::numFinalSolutions.

Referenced by JEGAOptimizer::GetBestSolutions().

**43.52.3.11 JEGA::DoubleMatrix ToDoubleMatrix (const VariablesArray & *variables*) const [protected]**

Converts the items in a VariablesArray into a DoubleMatrix whereby the items in the matrix are the design variables. The matrix will not contain responses but when being used by [Dakota](#), this doesn't matter. JEGA will attempt to re-evaluate these points but [Dakota](#) will recognize that they do not require re-evaluation and thus it will be a cheap operation.

**Parameters:**

*variables* The array of DakotaVariables objects to use as the contents of the returned matrix.

**Returns:**

The matrix created using the supplied VariablesArray.

Referenced by JEGAOptimizer::find\_optimum().

**43.52.3.12 void resize\_variables\_results\_array (std::size\_t *newsize*) [protected]**

Safely resizes the best variables array taking into account the requirements put forth by the envelope-letter design pattern. Do not directly call resize on the bestVariablesArray object unless you intend to share the internal content (letter) with other objects after assignment.

**Parameters:**

*newsize* The new size for the variables array.

References Iterator::bestVariablesArray.

Referenced by JEGAOptimizer::find\_optimum().

**43.52.3.13 void resize\_response\_results\_array (std::size\_t *newsize*) [protected]**

Safely resizes the best response array taking into account the requirements put forth by the envelope-letter design pattern. Do not directly call resize on the bestResponseArray object unless you intend to share the internal content (letter) with other objects after assignment.

**Parameters:**

*newsize* The new size for the responses array.

References Iterator::bestResponseArray.

Referenced by JEGAOptimizer::find\_optimum().

**43.52.3.14 void find\_optimum () [virtual]**

Performs the iterations to determine the optimal set of solutions. Override of pure virtual method in [Optimizer](#) base class.

The extraction of parameter values actually occurs in this method when the JEGA::FrontEnd::Driver::ExecuteAlgorithm is called. Also the loading of the problem and algorithm configurations occurs in this method. That way, if it is called more than once and the algorithm or problem has changed, it will be accounted for.

Implements [Optimizer](#).

References JEGAOptimizer::\_initPts, JEGAOptimizer::\_theEvalCreator, JEGAOptimizer::\_theParamDB, Driver::DestroyAlgorithm(), Driver::ExtractAllData(), JEGAOptimizer::GetBestSolutions(), JEGAOptimizer::initial\_points(), JEGAOptimizer::LoadAlgorithmConfig(), JEGAOptimizer::LoadDakotaResponses(), JEGAOptimizer::LoadProblemConfig(), Driver::PerformIterations(), JEGAOptimizer::resize\_response\_results\_array(), JEGAOptimizer::resize\_variables\_results\_array(), and JEGAOptimizer::ToDoubleMatrix().

#### **43.52.3.15 bool accepts\_multiple\_points () const [virtual]**

Overridden to return true since JEGA algorithms can accept multiple initial points.

**Returns:**

true, always.

Reimplemented from [Iterator](#).

#### **43.52.3.16 bool returns\_multiple\_points () const [virtual]**

Overridden to return true since JEGA algorithms can return multiple final points.

**Returns:**

true, always.

Reimplemented from [Iterator](#).

#### **43.52.3.17 void initial\_points (const VariablesArray & *pts*) [virtual]**

Overridden to assign the \_initPts member variable to the passed in collection of [Dakota::Variables](#).

**Parameters:**

*pts* The array of initial points for the JEGA algorithm created and run by this [JEGAOptimizer](#).

Reimplemented from [Iterator](#).

References JEGAOptimizer::\_initPts.

#### **43.52.3.18 const VariablesArray & initial\_points () const [virtual]**

Overridden to return the collection of initial points for the JEGA algorithm created and run by this [JEGAOptimizer](#).

**Returns:**

The collection of initial points for the JEGA algorithm created and run by this [JEGAOptimizer](#).

Reimplemented from [Iterator](#).

References [JEGAOptimizer::\\_initPts](#).

Referenced by [JEGAOptimizer::find\\_optimum\(\)](#).

## 43.52.4 Member Data Documentation

### 43.52.4.1 VariablesArray \_initPts [private]

An array of initial points to use as an initial population. This member is here to help support the use of JEGA algorithms in [Dakota](#) strategies. If this array is populated, then whatever initializer is specified will be ignored and the DoubleMatrix initializer will be used instead on a matrix created from the data in this array.

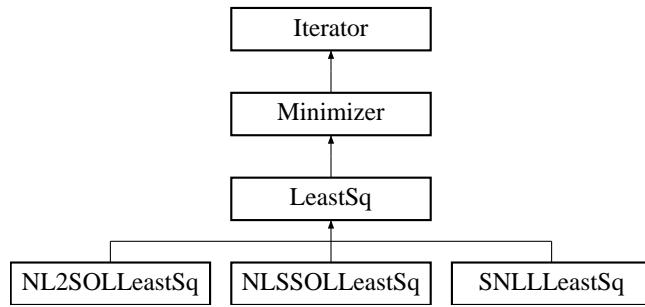

Referenced by [JEGAOptimizer::find\\_optimum\(\)](#), and [JEGAOptimizer::initial\\_points\(\)](#).

## Static Protected Attributes

- static `LeastSq * leastSqInstance`  
*pointer to `LeastSq` instance used in static member functions*

### 43.53.1 Detailed Description

Base class for the nonlinear least squares branch of the iterator hierarchy. The `LeastSq` class provides common data and functionality for least squares solvers (including `NL2OL`, `NLSSOLLeastSq`, and `SNLLLeastSq`).

## 43.53.2 Constructor & Destructor Documentation

### 43.53.2.1 LeastSq (Model & model) [protected]

standard constructor This constructor extracts the inherited data for the least squares branch and performs sanity checking on gradient and constraint settings.

References Dakota::abort\_handler(), Model::assign\_rep(), Iterator::bestVariablesArray, Variables::copy(), Model::current\_variables(), Minimizer::cvScaleTypes, ProblemDescDB::get\_bool(), ProblemDescDB::get\_sizet(), Model::init\_communicators(), RecastModel::initialize(), Minimizer::initialize\_scaling(), Iterator::iteratedModel, Iterator::maxConcurrency, Model::model\_rep(), Iterator::numContinuousVars, Iterator::numFunctions, Minimizer::numIterPrimaryFns, LeastSq::numLeastSqTerms, Minimizer::numNonlinearConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, LeastSq::obsData, LeastSq::obsDataFilename, LeastSq::obsDataFlag, Minimizer::optimizationFlag, Iterator::outputLevel, LeastSq::primary\_resp\_recast(), Model::primary\_response\_fn\_weights(), Minimizer::primaryRespScaleFlag, Iterator::probDescDB, Dakota::read\_data\_tabular(), Minimizer::responseScaleTypes, Minimizer::scaleFlag, Minimizer::secondary\_resp\_recast(), Minimizer::secondaryRespScaleFlag, Minimizer::variables\_recast(), Minimizer::varsScaleFlag, and LeastSq::weightFlag.

## 43.53.3 Member Function Documentation

### 43.53.3.1 void initialize\_run () [protected, virtual]

This function should be invoked (or reimplemented) by any derived implementations of [initialize\\_run\(\)](#) (which would otherwise hide it).

Reimplemented from [Minimizer](#).

Reimplemented in [SNLLLeastSq](#).

References Iterator::iteratedModel, LeastSq::leastSqInstance, LeastSq::obsDataFlag, LeastSq::prevLSqInstance, Minimizer::scaleFlag, and Model::update\_from\_subordinate\_model().

### 43.53.3.2 void run () [inline, protected, virtual]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References LeastSq::minimize\_residuals().

### 43.53.3.3 void post\_run (std::ostream & s) [protected, virtual]

Implements portions of post\_run specific to [LeastSq](#) for scaling back to native variables and functions. This function should be invoked (or reimplemented) by any derived implementations of [post\\_run\(\)](#) (which would otherwise hide it).

Reimplemented from [Iterator](#).

Reimplemented in [SNLLLeastSq](#).

References Dakota::abort\_handler(), Response::active\_set\_request\_vector(), Iterator::bestResponseArray, Iterator::bestVariablesArray, Variables::continuous\_variables(), Response::copy(), Minimizer::cvScaleMultipliers, Minimizer::cvScaleOffsets, Minimizer::cvScaleTypes, Response::function\_value(), Response::function\_values(), Iterator::iteratedModel, Minimizer::modify\_s2n(), Minimizer::need\_resp\_trans\_byvars(), LeastSq::numLeastSqTerms, Minimizer::numNonlinearConstraints, Model::primary\_response\_fn\_weights(), Minimizer::primaryRespScaleFlag, Minimizer::response\_modify\_s2n(), Minimizer::secondaryRespScaleFlag, Model::subordinate\_model(), Response::update\_partial(), Minimizer::varsScaleFlag, and LeastSq::weightFlag.

#### **43.53.3.4 void finalize\_run () [inline, protected, virtual]**

utility function to perform common operations following [post\\_run\(\)](#); deallocation and resetting of instance pointers Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [finalize\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented from [Minimizer](#).

Reimplemented in [SNLLLeastSq](#).

References LeastSq::leastSqInstance, and LeastSq::prevLSqInstance.

#### **43.53.3.5 void print\_results (std::ostream & s) [protected, virtual]**

Redefines default iterator results printing to include nonlinear least squares results (residual terms and constraints).

Reimplemented from [Iterator](#).

References Iterator::activeSet, Iterator::bestResponseArray, Iterator::bestVariablesArray, LeastSq::confBoundsLower, LeastSq::confBoundsUpper, Model::continuous\_variable\_labels(), Dakota::data\_pairs, Model::interface\_id(), Iterator::iteratedModel, Dakota::lookup\_by\_val(), Iterator::numContinuousVars, Iterator::numFunctions, LeastSq::numLeastSqTerms, ActiveSet::request\_values(), Dakota::write\_data\_partial(), and Dakota::write\_precision.

#### **43.53.3.6 void primary\_resp\_recast (const Variables & native\_vars, const Variables & scaled\_vars, const Response & native\_response, Response & iterator\_response) [static, protected]**

primary response conversion map for [RecastModel](#) used in scaling: transform least squares terms (fns, grads, Hessians) from native (user) to iterator space Least squares function map from user/native space to iterator/scaled space using a [RecastModel](#). If no scaling also copies constraints.

*destructor*
- void [write](#) (std::ostream &s) const  
*write a variable constraints object to an std::ostream*
- void [read](#) (std::istream &s)  
*read a variable constraints object from an std::istream*

### Protected Member Functions

- void [reshape](#) (const SizetArray &vc\_totals)  
*reshape the lower/upper bound arrays within the [Constraints](#) hierarchy*
- void [build\\_active\\_views](#) ()  
*construct active views of all variables bounds arrays*
- void [build\\_inactive\\_views](#) ()  
*construct inactive views of all variables bounds arrays*

### 43.54.1 Detailed Description

Derived class within the [Constraints](#) hierarchy which employs the merged data view. Derived variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The [MergedConstraints](#) derived class combines continuous and discrete domain types but separates design, uncertain, and state variable types. The result is merged design bounds arrays (`mergedDesignLowerBnds`, `mergedDesignUpperBnds`), uncertain distribution bounds arrays (`uncertainLowerBnds`, `uncertainUpperBnds`), and merged state bounds arrays (`mergedStateLowerBnds`, `mergedStateUpperBnds`). The branch and bound strategy uses this approach (see `Variables::get_variables(problem_db)` for variables type selection; variables type is passed to the [Constraints](#) constructor in [Model](#)).

### 43.54.2 Constructor & Destructor Documentation

#### 43.54.2.1 `MergedConstraints(const ProblemDescDB & problem_db, const SharedVariablesData & svd)`

standard constructor In this class, a merged data approach is used in which continuous and discrete arrays are combined into a single continuous array (integrality is relaxed; the converse of truncating reals is not currently supported but could be in the future if needed). Iterators/strategies which use this class include: `BranchBndOptimizer`. Extract fundamental lower and upper bounds and merge continuous and discrete domains to create `mergedDesignLowerBnds`, `mergedDesignUpperBnds`, `mergedStateLowerBnds`, and `mergedStateUpperBnds`.

References `Constraints::allContinuousLowerBnds`, `Constraints::allContinuousUpperBnds`, `Constraints::build_views()`, `SharedVariablesData::components_totals()`, `Dakota::copy_data_partial()`, `ProblemDescDB::get_idv()`, `ProblemDescDB::get_rdv()`, `Constraints::manage_linear_constraints()`, `Dakota::merge_data_partial()`, `Constraints::sharedVarsData`, and `SharedVariablesData::vc_lookup()`.

### 43.54.3 Member Function Documentation

#### 43.54.3.1 `void reshape(const SizetArray & vc_totals) [protected, virtual]`

reshape the lower/upper bound arrays within the [Constraints](#) hierarchy Resizes the derived bounds arrays.

Reimplemented from [Constraints](#).

References `Constraints::allContinuousLowerBnds`, `Constraints::allContinuousUpperBnds`, and `Constraints::build_views()`.

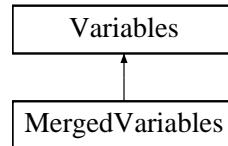

Referenced by `MergedConstraints::MergedConstraints()`.

The documentation for this class was generated from the following files:

- `MergedConstraints.H`
- `MergedConstraints.C`

### 43.55.1 Detailed Description

Derived class within the [Variables](#) hierarchy which employs the merged data view. Derived variables classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The [MergedVariables](#) derived class combines continuous and discrete domain types but separates design, uncertain, and state variable types. The result is a single continuous array of design variables (`mergedDesignVars`), a single continuous array of uncertain variables (`uncertainVars`), and a single continuous array of state variables (`mergedStateVars`). The branch and bound strategy uses this approach (see `Variables::get_variables(problem_db)`).

### 43.55.2 Constructor & Destructor Documentation

#### 43.55.2.1 `MergedVariables (const ProblemDescDB & problem_db, const std::pair< short, short > & view)`

standard constructor In this class, a merged data approach is used in which continuous and discrete arrays are combined into a single continuous array (integrity is relaxed; the converse of truncating reals is not currently supported but could be in the future if needed). Iterators/strategies which use this class include: `BranchBoundOptimizer`. Extract fundamental variable types and labels and merge continuous and discrete domains to create aggregate arrays and views.

References `Variables::allContinuousVars`, `Variables::build_views()`, `SharedVariablesData::components_totals()`, `Dakota::copy_data_partial()`, `ProblemDescDB::get_idv()`, `ProblemDescDB::get_rdv()`, `Dakota::merge_data_partial()`, `Variables::sharedVarsData`, `SharedVariablesData::vc_lookup()`, and `SharedVariablesData::view()`.

### 43.55.3 Member Function Documentation

#### 43.55.3.1 `void read_tabular (std::istream & s) [protected, virtual]`

Presumes variables object is appropriately sized to receive data

Reimplemented from [Variables](#).

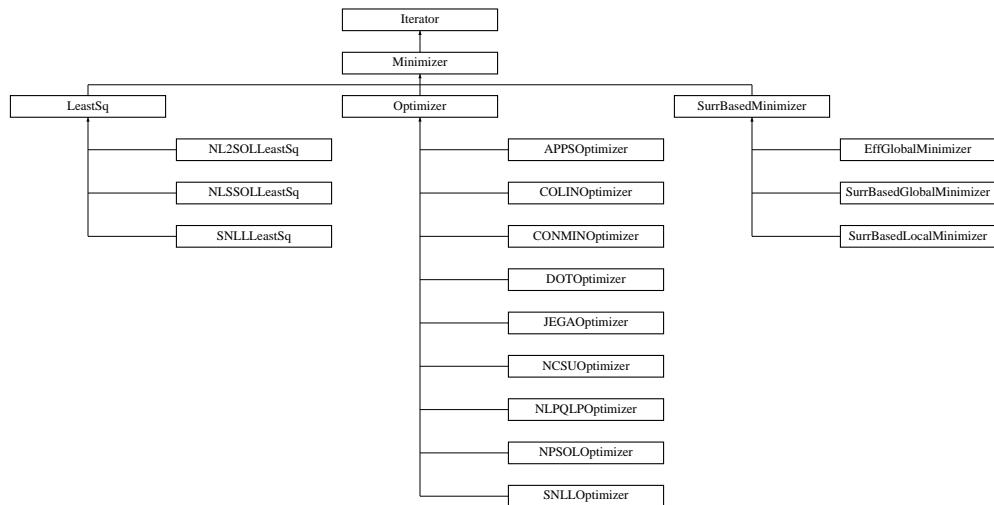

References `Variables::allContinuousVars`, `SharedVariablesData::components_totals()`, `Dakota::read_data_partial_tabular()`, and `Variables::sharedVarsData`.

The documentation for this class was generated from the following files:

- `MergedVariables.H`
- `MergedVariables.C`

## 43.56 Minimizer Class Reference

Base class for the optimizer and least squares branches of the iterator hierarchy. Inheritance diagram for Minimizer::

### Protected Member Functions

- **Minimizer ()**  
*default constructor*
- **Minimizer (Model &model)**  
*standard constructor*
- **Minimizer (NoDBBaseConstructor, Model &model)**  
*alternate constructor for "on the fly" instantiations*
- **Minimizer (NoDBBaseConstructor, size\_t num\_lin\_ineq, size\_t num\_lin\_eq, size\_t num\_nln\_ineq, size\_t num\_nln\_eq)**

### 43.56.1 Detailed Description

Base class for the optimizer and least squares branches of the iterator hierarchy. The [Minimizer](#) class provides common data and functionality for [Optimizer](#) and [LeastSq](#).

### 43.56.2 Constructor & Destructor Documentation

#### 43.56.2.1 Minimizer ([Model](#) & [model](#)) [protected]

standard constructor This constructor extracts inherited data for the optimizer and least squares branches and performs sanity checking on constraint settings.

References Dakota::abort\_handler(), Response::active\_set\_request\_vector(), String::begins(), Iterator::bestResponseArray, Minimizer::bigIntBoundSize, Minimizer::bigRealBoundSize, Minimizer::boundConstraintFlag, Model::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Response::copy(), Model::current\_response(), Model::discrete\_int\_lower\_bounds(), Model::discrete\_int\_upper\_bounds(), Model::discrete\_real\_lower\_bounds(), Model::discrete\_real\_upper\_bounds(), String::ends(), ProblemDescDB::get\_sizet(), Iterator::gradientType, Iterator::hessianType, Iterator::maxIterations, Iterator::methodName, Iterator::methodSource, Iterator::numContinuousVars, Iterator::numDiscreteIntVars, Iterator::numDiscreteRealVars, Iterator::numFinalSolutions, Iterator::numFunctions, Minimizer::numLinearEqConstraints, Minimizer::numLinearIneqConstraints, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Iterator::probDescDB, and Minimizer::vendorNumericalGradFlag.

### 43.56.3 Member Function Documentation

#### 43.56.3.1 void initialize\_run () [protected, virtual]

utility function to perform common operations prior to [pre\\_run\(\)](#); typically memory initialization; setting of instance pointers Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [initialize\\_run\(\)](#), typically \_before\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

Reimplemented in [CONMINOptimizer](#), [LeastSq](#), [Optimizer](#), [DOTOptimizer](#), [NLPQLPOptimizer](#), [SNLLLeastSq](#), and [SNLLOptimizer](#).

References Model::all\_continuous\_variables(), Model::all\_discrete\_int\_variables(), Model::all\_discrete\_real\_variables(), Iterator::bestVariablesArray, Iterator::iteratedModel, Minimizer::minimizerInstance, Minimizer::prevMinInstance, and Iterator::subIteratorFlag.

**43.56.3.2 void finalize\_run() [inline, protected, virtual]**

utility function to perform common operations following [post\\_run\(\)](#); deallocation and resetting of instance pointers  
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [finalize\\_run\(\)](#), typically `_after_` performing its own implementation steps.

Reimplemented from [Iterator](#).

Reimplemented in [LeastSq](#), [Optimizer](#), [SNLLLeastSq](#), and [SNLLOptimizer](#).

References `Minimizer::minimizerInstance`, and `Minimizer::prevMinInstance`.

**43.56.3.3 void initialize\_scaling() [protected]**

initialize scaling types, multipliers, and offsets; perform error checking helper function used in constructors of derived classes to set up scaling types, multipliers and offsets when input scaling flag is enabled

References `Dakota::abort_handler()`, `Minimizer::compute_scaling()`, `Model::continuous_lower_bounds()`, `Model::continuous_upper_bounds()`, `Model::continuous_variable_labels()`, `Model::continuous_variables()`, `Dakota::copy_data()`, `Minimizer::cvScaleMultipliers`, `Minimizer::cvScaleOffsets`, `Minimizer::cvScaleTypes`, `ProblemDescDB::get_dsa()`, `ProblemDescDB::get_rdv()`, `Iterator::iteratedModel`, `Minimizer::lin_coeffs_modify_n2s()`, `Model::linear_eq_constraint_coeffs()`, `Model::linear_eq_constraint_targets()`, `Model::linear_ineq_constraint_coeffs()`, `Model::linear_ineq_constraint_lower_bounds()`, `Model::linear_ineq_constraint_upper_bounds()`, `Minimizer::linearEqScaleMultipliers`, `Minimizer::linearEqScaleOffsets`, `Minimizer::linearEqScaleTypes`, `Minimizer::linearIneqScaleMultipliers`, `Minimizer::linearIneqScaleOffsets`, `Minimizer::linearIneqScaleTypes`, `Model::model_rep()`, `Minimizer::modify_n2s()`, `Model::nonlinear_eq_constraint_targets()`, `Model::nonlinear_ineq_constraint_lower_bounds()`, `Model::nonlinear_ineq_constraint_upper_bounds()`, `Iterator::numContinuousVars`, `Iterator::numFunctions`, `Minimizer::numLinearEqConstraints`, `Minimizer::numLinearIneqConstraints`, `Minimizer::numNonlinearEqConstraints`, `Minimizer::numNonlinearIneqConstraints`, `Minimizer::numUserPrimaryFns`, `Iterator::outputLevel`, `Minimizer::primaryRespScaleFlag`, `Minimizer::print_scaling()`, `Iterator::probDescDB`, `Model::response_labels()`, `Minimizer::responseScaleMultipliers`, `Minimizer::responseScaleOffsets`, `Minimizer::responseScaleTypes`, `Minimizer::secondaryRespScaleFlag`, `RecastModel::submodel_supports_derivative_estimation()`, `Model::subordinate_model()`, `Model::supports_derivative_estimation()`, and `Minimizer::varsScaleFlag`.

**43.56.3.4 void variables\_recast (const Variables & scaled\_vars, Variables & native\_vars) [static, protected]**

variables conversion map for [RecastModel](#) used in scaling: transform variables from scaled to native (user) space  
`Variables` map from iterator/scaled space to user/native space using a [RecastModel](#).

References `Variables::continuous_variable_labels()`, `Variables::continuous_variables()`, `Minimizer::cvScaleMultipliers`, `Minimizer::cvScaleOffsets`, `Minimizer::cvScaleTypes`, `Minimizer::minimizerInstance`, `Minimizer::modify_s2n()`, `Iterator::outputLevel`, and `Dakota::write_data()`.

Referenced by `LeastSq::LeastSq()`, and `Optimizer::Optimizer()`.

---

**43.56.3.5 void gnewton\_set\_recast (const Variables & *recast\_vars*, const ActiveSet & *recast\_set*, ActiveSet & *sub\_model\_set*) [static, protected]**

conversion of request vector values for the Gauss-Newton Hessian approximation For Gauss-Newton Hessian requests, activate the 2 bit and mask the 4 bit.

References ActiveSet::request\_value(), and ActiveSet::request\_vector().

Referenced by Optimizer::Optimizer(), and SurrBasedLocalMinimizer::SurrBasedLocalMinimizer().

**43.56.3.6 void secondary\_resp\_recast (const Variables & *native\_vars*, const Variables & *scaled\_vars*, const Response & *native\_response*, Response & *iterator\_response*) [static, protected]**

secondary response conversion map for [RecastModel](#) used in scaling: transform constraints (fns, grads, Hessians) from native (user) to Constraint function map from user/native space to iterator/scaled/combined space using a [RecastModel](#).

References Response::active\_set\_request\_vector(), Minimizer::minimizerInstance, Minimizer::need\_resp\_trans\_byvars(), Minimizer::numIterPrimaryFns, Minimizer::numNonlinearConstraints, Minimizer::numUserPrimaryFns, Minimizer::response\_modify\_n2s(), Minimizer::secondaryRespScaleFlag, and Response::update\_partial().

Referenced by LeastSq::LeastSq(), and Optimizer::Optimizer().

**43.56.3.7 bool need\_resp\_trans\_byvars (const ShortArray & *asv*, int *start\_index*, int *num\_resp*) [protected]**

determine if response transformation is needed due to variable transformations Determine if variable transformations present and derivatives requested, which implies a response transformation is necessary

References Minimizer::varsScaleFlag.

Referenced by Optimizer::post\_run(), LeastSq::post\_run(), Optimizer::primary\_resp\_recast(), LeastSq::primary\_resp\_recast(), and Minimizer::secondary\_resp\_recast().

**43.56.3.8 RealVector modify\_n2s (const RealVector & *native\_vars*, const IntArray & *scale\_types*, const RealVector & *multipliers*, const RealVector & *offsets*) const [protected]**

general RealVector mapping from native to scaled variables vectors: general RealVector mapping from native to scaled variables; loosely, in greatest generality: scaled\_var = log( (native\_var - offset) / multiplier )

Referenced by Minimizer::initialize\_scaling().

**43.56.3.9 RealVector modify\_s2n (const RealVector & *scaled\_vars*, const IntArray & *scale\_types*, const RealVector & *multipliers*, const RealVector & *offsets*) const [protected]**

general RealVector mapping from scaled to native variables (and values) general RealVector mapping from scaled to native variables and/or vals; loosely, in greatest generality: scaled\_var = (LOG\_BASE<sup>n</sup>scaled\_var) \* multiplier + offset

Referenced by SNLLLeastSq::post\_run(), Optimizer::post\_run(), LeastSq::post\_run(), COLINOptimizer::post\_run(), and Minimizer::variables\_recast().

**43.56.3.10 void response\_modify\_n2s (const Variables & *native\_vars*, const Response & *native\_response*, Response & *recast\_response*, int *native\_offset*, int *recast\_offset*, int *num\_responses*) const [protected]**

map responses from native to scaled variable space scaling response mapping: modifies response from a model (user/native) for use in iterators (scaled) -- not including MOO/NLS objective reductions

References Response::active\_set(), Variables::acv(), Variables::all\_continuous\_variable\_ids(), Variables::all\_continuous\_variables(), Variables::continuous\_variable\_ids(), Variables::continuous\_variables(), Dakota::copy\_data(), Variables::cv(), Minimizer::cvScaleMultipliers, Minimizer::cvScaleOffsets, Minimizer::cvScaleTypes, Dakota::find\_index(), Response::function\_gradient\_view(), Response::function\_gradients(), Response::function\_hessian\_view(), Response::function\_hessians(), Response::function\_labels(), Response::function\_value(), Response::function\_values(), Variables::icv(), Variables::inactive\_continuous\_variable\_ids(), Variables::inactive\_continuous\_variables(), Minimizer::numIterPrimaryFns, Iterator::outputLevel, Minimizer::responseScaleMultipliers, Minimizer::responseScaleOffsets, Minimizer::responseScaleTypes, Dakota::write\_col\_vector\_trans(), Dakota::write\_data(), and Dakota::write\_precision.

Referenced by Optimizer::primary\_resp\_recast(), LeastSq::primary\_resp\_recast(), and Minimizer::secondary\_resp\_recast().

**43.56.3.11 void response\_modify\_s2n (const Variables & *native\_vars*, const Response & *scaled\_response*, Response & *native\_response*, int *scaled\_offset*, int *native\_offset*, int *num\_responses*) const [protected]**

map responses from scaled to native variable space scaling response mapping: modifies response from scaled (iterator) to native (user) space -- not including MOO/NLS objective reductions

References Response::active\_set(), Variables::acv(), Variables::all\_continuous\_variable\_ids(), Variables::all\_continuous\_variables(), Variables::continuous\_variable\_ids(), Variables::continuous\_variables(), Dakota::copy\_data(), Variables::cv(), Minimizer::cvScaleMultipliers, Minimizer::cvScaleOffsets, Minimizer::cvScaleTypes, Dakota::find\_index(), Response::function\_gradient\_view(), Response::function\_gradients(), Response::function\_hessian\_view(), Response::function\_hessians(), Response::function\_labels(), Response::function\_value(), Response::function\_values(), Variables::icv(), Variables::inactive\_continuous\_variable\_ids(), Variables::inactive\_continuous\_variables(), Minimizer::numIterPrimaryFns, Iterator::outputLevel, Minimizer::responseScaleMultipliers, Minimizer::responseScaleOffsets, Minimizer::responseScaleTypes, Dakota::write\_col\_vector\_trans(), Dakota::write\_data(), and Dakota::write\_precision.

Referenced by Optimizer::post\_run(), and LeastSq::post\_run().

**43.56.3.12 RealMatrix lin\_coeffs\_modify\_n2s (const RealMatrix & *src\_coeffs*, const RealVector & *cv\_multipliers*, const RealVector & *lin\_multipliers*) const [protected]**

general linear coefficients mapping from native to scaled space compute scaled linear constraint matrix given design variable multipliers and linear scaling multipliers. Only scales components corresponding to continuous variables so for src\_coeffs of size MxN, lin\_multipliers.size() <= M, cv\_multipliers.size() <= N

Referenced by Minimizer::initialize\_scaling().

### 43.56.3.13 Real objective (const RealVector & *fn\_vals*, const RealVector & *primary\_wts*) const [protected]

compute a composite objective value from one or more primary functions. The composite objective computation sums up the contributions from one or more primary functions using the primary response fn weights.

References Minimizer::numUserPrimaryFns, and Minimizer::optimizationFlag.

Referenced by SurrBasedLocalMinimizer::approx\_subprob\_objective\_eval(), SurrBasedMinimizer::augmented\_lagrangian\_merit(), EffGlobalMinimizer::expected\_improvement(), SurrBasedMinimizer::lagrangian\_merit(), Optimizer::objective\_reduction(), SurrBasedMinimizer::penalty\_merit(), COLINOptimizer::post\_run(), SurrBasedMinimizer::update\_filter(), and SurrBasedLocalMinimizer::update\_penalty().

### 43.56.3.14 void objective\_gradient (const RealVector & *fn\_vals*, const RealMatrix & *fn\_grads*, const RealVector & *primary\_wts*, RealVector & *obj\_grad*) const [protected]

compute the gradient of the composite objective function. The composite objective gradient computation combines the contributions from one of more primary function gradients, including the effect of any primary function weights. In the case of a linear mapping (MOO), only the primary function gradients are required, but in the case of a nonlinear mapping (NLS), primary function values are also needed. Within [RecastModel::set\\_mapping\(\)](#), the active set requests are automatically augmented to make values available when needed, based on nonlinear-RespMapping settings.

References Iterator::numContinuousVars, Minimizer::numUserPrimaryFns, and Minimizer::optimizationFlag.

### 43.56.3.15 void objective\_hessian (const RealVector & *fn\_vals*, const RealMatrix & *fn\_grads*, const RealSymMatrixArray & *fn\_hessians*, const RealVector & *primary\_wts*, RealSymMatrix & *obj\_hess*) const [protected]

compute the Hessian of the composite objective function. The composite objective Hessian computation combines the contributions from one of more primary function Hessians, including the effect of any primary function weights. In the case of a linear mapping (MOO), only the primary function Hessians are required, but in the case of a nonlinear mapping (NLS), primary function values and gradients are also needed in general (gradients only in the case of a Gauss-Newton approximation). Within the default [RecastModel::set\\_mapping\(\)](#), the active set requests are automatically augmented to make values and gradients available when needed, based on nonlinearRespMapping settings.

References Dakota::abort\_handler(), Iterator::numContinuousVars, Minimizer::numUserPrimaryFns, and Minimizer::optimizationFlag.

*construct inactive views of all variables bounds arrays*

### 43.57.1 Detailed Description

Derived class within the [Constraints](#) hierarchy which employs the default data view (no variable or domain type array merging). Derived variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The [MixedConstraints](#) derived class separates the design, uncertain, and state variable types as well as the continuous and discrete domain types. The result is separate lower and upper bounds arrays for continuous design, discrete design, uncertain, continuous state, and discrete state variables. This is the default approach, so all iterators and strategies not specifically utilizing the All or Merged views use this approach (see `Variables::get_variables(problem_db)` for variables type selection; variables type is passed to the [Constraints](#) constructor in [Model](#)).

### 43.57.2 Constructor & Destructor Documentation

#### 43.57.2.1 `MixedConstraints(const ProblemDescDB & problem_db, const SharedVariablesData & svd)`

standard constructor In this class, mixed continuous/discrete variables are used. Most iterators/strategies use this approach, which is the default in [Constraints::get\\_constraints\(\)](#).

### 43.58.1 Detailed Description

Derived class within the [Variables](#) hierarchy which employs the default data view (no variable or domain type array merging). Derived variables classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The [MixedVariables](#) derived class separates the design, uncertain, and state variable types as well as the continuous and discrete domain types. The result is separate arrays for continuous design, discrete design, uncertain, continuous state, and discrete state variables. This is the default approach, so all iterators and strategies not specifically utilizing the All or Merged views use this approach (see `Variables::get_variables(problem_db)`).

### 43.58.2 Constructor & Destructor Documentation

#### 43.58.2.1 `MixedVariables(const ProblemDescDB & problem_db, const std::pair< short, short > & view)`

standard constructor In this class, the distinct approach is used (design, uncertain, and state variable types and continuous and discrete domain types are distinct). Most iterators/strategies use this approach.

References `Variables::allContinuousVars`, `Variables::allDiscreteIntVars`, `Variables::allDiscreteRealVars`, `Variables::build_views()`, `SharedVariablesData::components_totals()`, `Dakota::copy_data_partial()`, `ProblemDescDB::get_idv()`, `ProblemDescDB::get_rdv()`, `Variables::sharedVarsData`, and `SharedVariablesData::vc_lookup()`.

### 43.58.3 Member Function Documentation

#### 43.58.3.1 `void read_tabular(std::istream & s) [protected, virtual]`

Presumes variables object is already appropriately sized to receive!

Reimplemented from [Variables](#).

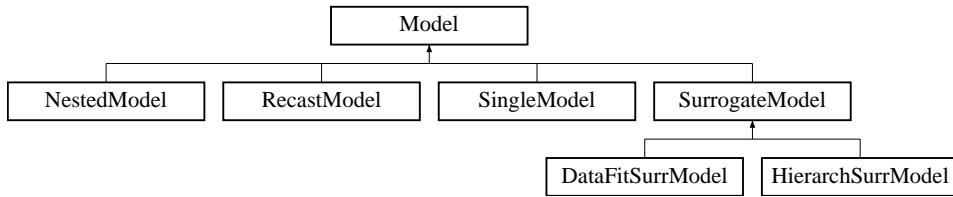

References `Variables::allContinuousVars`, `Variables::allDiscreteIntVars`, `Variables::allDiscreteRealVars`, and `Dakota::read_data_tabular()`.

The documentation for this class was generated from the following files:

- `MixedVariables.H`
- `MixedVariables.C`

## 43.59 Model Class Reference

Base class for the model class hierarchy. Inheritance diagram for Model::

### Public Member Functions

- **Model ()**  
*default constructor*
- **Model (ProblemDescDB &problem\_db)**  
*standard constructor for envelope*
- **Model (const Model &model)**  
*copy constructor*
- **virtual ~Model ()**  
*destructor*
- **Model operator= (const Model &model)**  
*assignment operator*
- **virtual Iterator & subordinate\_iterator ()**  
*return the sub-iterator in nested and surrogate models*
- **virtual Model & subordinate\_model ()**  
*return a single sub-model defined from subModel in nested and recast models and truth\_model() in surrogate models; used for a directed dive through model recursions that may bypass some components.*
- **virtual Model & surrogate\_model ()**  
*return the approximation sub-model in surrogate models*
- **virtual Model & truth\_model ()**  
*return the truth sub-model in surrogate models*
- **virtual void derived\_subordinate\_models (ModelList &m1, bool recurse\_flag)**  
*portion of subordinate\_models() specific to derived model classes*
- **virtual void update\_from\_subordinate\_model (bool recurse\_flag=true)**

*propagate vars/labels/bounds/targets from the bottom up*

- virtual **Interface & interface** ()
 

*return the interface employed by the derived model class, if present: [SingleModel::userDefinedInterface](#), [DataFit-SurrModel::approxInterface](#), or [NestedModel::optionalInterface](#)*
- virtual void **primary\_response\_fn\_weights** (const RealVector &wts, bool recurse\_flag=true)
 

*set the relative weightings for multiple objective functions or least squares terms*
- virtual void **surrogate\_function\_indices** (const IntSet &surr\_fn\_indices)
 

*set the (currently active) surrogate function index set*
- virtual void **build\_approximation** ()
 

*build a new [SurrogateModel](#) approximation*
- virtual bool **build\_approximation** (const **Variables** &vars, const IntResponsePair &response\_pr)
 

*build a new [SurrogateModel](#) approximation using/enforcing response at vars*
- virtual void **update\_approximation** (bool rebuild\_flag)
 

*replace the approximation data within an existing surrogate based on data updates propagated elsewhere*
- virtual void **update\_approximation** (const **Variables** &vars, const IntResponsePair &response\_pr, bool rebuild\_flag)
 

*replace the anchor point data within an existing surrogate*
- virtual void **update\_approximation** (const VariablesArray &vars\_array, const IntResponseMap &resp\_map, bool rebuild\_flag)
 

*replace the data points within an existing surrogate*
- virtual void **append\_approximation** (bool rebuild\_flag)
 

*append to the existing approximation data within a surrogate based on data updates propagated elsewhere*
- virtual void **append\_approximation** (const **Variables** &vars, const IntResponsePair &response\_pr, bool rebuild\_flag)
 

*append a single point to an existing surrogate's data*
- virtual void **append\_approximation** (const VariablesArray &vars\_array, const IntResponseMap &resp\_map, bool rebuild\_flag)
 

*append multiple points to an existing surrogate's data*
- virtual void **pop\_approximation** (bool save\_surr\_data)
 

*remove the previous data set addition to a surrogate (e.g., due to a previous [append\\_approximation\(\)](#) call); flag manages storing of surrogate data for use in a subsequent [restore\\_approximation\(\)](#)*
- virtual void **restore\_approximation** ()
 

*restore a previous approximation data state within a surrogate*

- **virtual bool restore\_available ()**  
*query for whether a trial increment is restorable within a surrogate*
- **virtual void finalize\_approximation ()**  
*finalize an approximation by applying all previous trial increments*
- **virtual void store\_approximation ()**  
*move the current approximation into storage for later combination*
- **virtual void combine\_approximation (short corr\_type)**  
*combine the current approximation with one previously stored*
- **virtual bool force\_rebuild ()**  
*determine whether a surrogate model rebuild should be forced based on changes in the inactive data*
- **virtual std::vector< Approximation > & approximations ()**  
*retrieve the set of Approximations within a DataFitSurrModel*
- **virtual const Pecos::SurrogateData & approximation\_data (size\_t index)**  
*retrieve the approximation data from a particular Approximation instance within a DataFitSurrModel*
- **virtual const RealVectorArray & approximation\_coefficients ()**  
*retrieve the approximation coefficients from each Approximation within a DataFitSurrModel*
- **virtual void approximation\_coefficients (const RealVectorArray &approx\_coeffs)**  
*set the approximation coefficients for each Approximation within a DataFitSurrModel*
- **virtual const RealVector & approximation\_variances (const RealVector &c\_vars)**  
*retrieve the approximation variances from each Approximation within a DataFitSurrModel*
- **virtual void surrogate\_response\_mode (short mode)**  
*set response computation mode used in SurrogateModels for forming currentResponse*
- **virtual short surrogate\_response\_mode () const**  
*return response computation mode used in SurrogateModels for forming currentResponse*
- **virtual DiscrepancyCorrection & discrepancy\_correction ()**  
*return the DiscrepancyCorrection object used by SurrogateModels*
- **virtual void component\_parallel\_mode (short mode)**  
*update component parallel mode for supporting parallelism in a model's interface component, sub-model component, or neither component [componentParallelMode = 0 (none), 1 (INTERFACE/APPROX\_INTERFACE/OPTIONAL\_INTERFACE/LF\_MODEL/SURROGATE\_MODEL), or 2 (SUB\_MODEL/ACTUAL\_MODEL/HF\_MODEL/TRUTH\_MODEL)].*
- **virtual String local\_eval\_synchronization ()**

- **virtual int local\_evalConcurrency ()**  
*return derived model synchronization setting*
- **virtual void serve ()**  
*Service job requests received from the master. Completes when a termination message is received from [stop\\_servers\(\)](#).*
- **virtual void stop\_servers ()**  
*Executed by the master to terminate all server operations for a particular model when iteration on the model is complete.*
- **virtual bool derived\_master\_overload () const**  
*Return a flag indicating the combination of multiprocessor evaluations and a dedicated master iterator scheduling. Used in synchronous compute\_response functions to prevent the error of trying to run a multiprocessor job on the master.*
- **virtual void inactive\_view (short view, bool recurse\_flag=true)**  
*update the Model's inactive view based on higher level (nested) context*
- **virtual const String & interface\_id () const**  
*return the interface identifier*
- **virtual int evaluation\_id () const**  
*Return the value of the evaluation id counter for the Model.*
- **virtual bool evaluation\_cache () const**  
*Indicates the usage of an evaluation cache by the Model.*
- **virtual void set\_evaluation\_reference ()**  
*Set the reference points for the evaluation counters within the Model.*
- **virtual void fine\_grained\_evaluation\_counters ()**  
*Request fine-grained evaluation reporting within the Model.*
- **virtual void print\_evaluation\_summary (std::ostream &s, bool minimal\_header=false, bool relative\_count=true) const**  
*Print an evaluation summary for the Model.*
- **ModelList & subordinate\_models (bool recurse\_flag=true)**  
*return the sub-models in nested and surrogate models*
- **void compute\_response ()**  
*Compute the Response at currentVariables (default ActiveSet).*
- **void compute\_response (const ActiveSet &set)**

Compute the *Response* at *currentVariables* (specified *ActiveSet*).

- void **asynch\_compute\_response** ()  
*Spawn an asynchronous job (or jobs) that computes the value of the *Response* at *currentVariables* (default *ActiveSet*).*
- void **asynch\_compute\_response** (const *ActiveSet* &*set*)  
*Spawn an asynchronous job (or jobs) that computes the value of the *Response* at *currentVariables* (specified *ActiveSet*).*
- const *IntResponseMap* & **synchronize** ()  
*Execute a blocking scheduling algorithm to collect the complete set of results from a group of asynchronous evaluations.*
- const *IntResponseMap* & **synchronize\_nowait** ()  
*Execute a nonblocking scheduling algorithm to collect all available results from a group of asynchronous evaluations.*
- void **init\_communicators** (const int &*max\_iterator\_concurrency*, bool *re recurse\_flag=true*)  
*allocate communicator partitions for a model and store configuration in *modelPCIterMap**
- void **init\_serial** ()  
*for cases where *init\_communicators()* will not be called, modify some default settings to behave properly in serial.*
- void **set\_communicators** (const int &*max\_iterator\_concurrency*, bool *re recurse\_flag=true*)  
*set active parallel configuration for the model (set *modelPCIter* from *modelPCIterMap*)*
- void **free\_communicators** (const int &*max\_iterator\_concurrency*, bool *re recurse\_flag=true*)  
*deallocate communicator partitions for a model*
- void **stop\_configurations** ()  
*called from *Strategy::init\_iterator()* for iteratorComm rank 0 to terminate *serve\_configurations()* on other iterator-Comm processors*
- int **serve\_configurations** ()  
*called from *Strategy::init\_iterator()* for iteratorComm rank != 0 to balance *init\_communicators()* calls on iterator-Comm rank 0*

*number of objects sharing modelRep*

### 43.59.1 Detailed Description

Base class for the model class hierarchy. The [Model](#) class is the base class for one of the primary class hierarchies in DAKOTA. The model hierarchy contains a set of variables, an interface, and a set of responses, and an iterator operates on the model to map the variables into responses using the interface. For memory efficiency and enhanced polymorphism, the model hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Model](#)) serves as the envelope and one of the derived classes (selected in [Model::get\\_model\(\)](#)) serves as the letter.

### 43.59.2 Constructor & Destructor Documentation

#### 43.59.2.1 Model ()

default constructor The default constructor is used in `vector<Model>` instantiations and for initialization of [Model](#) objects contained in [Iterator](#) and derived [Strategy](#) classes. `modelRep` is `NULL` in this case (a populated `problem_db` is needed to build a meaningful [Model](#) object). This makes it necessary to check for `NULL` in the copy constructor, assignment operator, and destructor.

#### 43.59.2.2 Model ([ProblemDescDB](#) & `problem_db`)

standard constructor for envelope Used in model instantiations within strategy constructors. Envelope constructor only needs to extract enough data to properly execute `get_model`, since `Model(BaseConstructor, problem_db)` builds the actual base class data for the derived models.

References `Dakota::abort_handler()`, `Model::get_model()`, and `Model::modelRep`.

#### 43.59.2.3 Model (`const Model & model`)

copy constructor Copy constructor manages sharing of `modelRep` and incrementing of `referenceCount`.

References `Model::modelRep`, and `Model::referenceCount`.

#### 43.59.2.4 ~Model () [virtual]

destructor Destructor decrements `referenceCount` and only deletes `modelRep` when `referenceCount` reaches zero.

References `Model::modelRep`, and `Model::referenceCount`.

#### 43.59.2.5 Model ([BaseConstructor](#), [ProblemDescDB](#) & `problem_db`) [protected]

constructor initializing the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor builds the base class data for all inherited models. `get_model()` instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling `get_model()` again). Since the letter IS the representation, its representation pointer is set to `NULL` (an uninitialized pointer causes problems in `~Model`).

References `Model::fdGradSS`, `Model::fdHessByFnSS`, `Model::fdHessByGradSS`, `Model::gradIdNumerical`, `Model::gradType`, `Model::hessIdNumerical`, and `Model::hessType`.

### 43.59.2.6 Model (`RecastBaseConstructor`, `ProblemDescDB & problem_db`, `ParallelLibrary & parallel_lib`) [protected]

constructor initializing base class for recast model class instances constructed on the fly. This constructor also builds the base class data for inherited models. However, it is used for recast models which are instantiated on the fly. Therefore it only initializes a small subset of attributes. Note that `parallel_lib` is managed separately from `problem_db` since `parallel_lib` is needed even in cases where `problem_db` is an empty envelope (i.e., use of `dummy_db` in `Model(NoDBBaseConstructor)` above).

## 43.59.3 Member Function Documentation

### 43.59.3.1 Model operator= (const Model & model)

assignment operator Assignment operator decrements `referenceCount` for old `modelRep`, assigns new `modelRep`, and increments `referenceCount` for new `modelRep`.

References `Model::modelRep`, and `Model::referenceCount`.

### 43.59.3.2 Iterator & subordinate\_iterator () [virtual]

return the sub-iterator in nested and surrogate models return by reference requires use of dummy objects, but is important to allow use of `assign_rep()` since this operation must be performed on the original envelope object.

Reimplemented in [DataFitSurrModel](#), [NestedModel](#), and [RecastModel](#).

References `Dakota::dummy_iterator`, `Model::modelRep`, and `Model::subordinate_iterator()`.

Referenced by `NonDExpansion::compute_expansion()`, `NonDExpansion::compute_print_converged_results()`, `NonDExpansion::compute_print_iteration_results()`, `NonDExpansion::finalize_sets()`, `NonDGlobalReliability::get_best_sample()`, `NonDPolynomialChaos::increment_expansion()`, `NonDExpansion::increment_sets()`, `NLPQLPOptimizer::initialize()`, `NCSUOptimizer::initialize()`, `DOTOptimizer::initialize()`, `CONMINOptimizer::initialize()`, `NonDExpansion::initialize_expansion()`, `NonDExpansion::initialize_sets()`, `NonDStochCollocation::initialize_u_space_model()`, `NonDPolynomialChaos::initialize_u_space_model()`, `NonDExpansion::initialize_u_space_model()`, `SurrBasedLocalMinimizer::minimize_surrogates()`, `SurrBasedGlobalMinimizer::minimize_surrogates()`, `NonDLocalInterval::NonDLocalInterval()`, `NonDLocalReliability::NonDLocalReliability()`, `NonDGlobalReliability::optimize_gaussian_process()`, `NonDExpansion::refine_expansion()`, `SOLBase::SOLBase()`, `RecastModel::subordinate_iterator()`, `Model::subordinate_iterator()`, and `NonDExpansion::update_hierarchy()`.

### 43.59.3.3 Model & subordinate\_model () [virtual]

return a single sub-model defined from `subModel` in nested and recast models and `truth_model()` in surrogate models; used for a directed dive through model recursions that may bypass some components. return by reference requires use of dummy objects, but is important to allow use of `assign_rep()` since this operation must be performed on the original envelope object.

Reimplemented in [NestedModel](#), [RecastModel](#), and [SurrogateModel](#).

References `Dakota::dummy_model`, `Model::modelRep`, and `Model::subordinate_model()`.

Referenced by NonDGlobalReliability::expected\_feasibility(), NonDGlobalReliability::expected\_improvement(), SurrogateModel::force\_rebuild(), Minimizer::initialize\_scaling(), NonDExpansion::initialize\_u\_space\_model(), NonDGlobalReliability::optimize\_gaussian\_process(), LeastSq::post\_run(), COLINOptimizer::post\_run(), Optimizer::primary\_resp\_recast(), LeastSq::primary\_resp\_recast(), Model::subordinate\_model(), and DataFitSurrModel::update\_global().

#### **43.59.3.4 Model & surrogate\_model () [virtual]**

return the approximation sub-model in surrogate models return by reference requires use of dummy objects, but is important to allow use of [assign\\_rep\(\)](#) since this operation must be performed on the original envelope object.

Reimplemented in [DataFitSurrModel](#), [HierarchSurrModel](#), and [RecastModel](#).

References Dakota::dummy\_model, Model::modelRep, and Model::surrogate\_model().

Referenced by SurrBasedLocalMinimizer::find\_center\_approx(), SurrBasedLocalMinimizer::minimize\_surrogates(), SurrBasedGlobalMinimizer::minimize\_surrogates(), SurrBasedLocalMinimizer::SurrBasedLocalMinimizer(), RecastModel::surrogate\_model(), and Model::surrogate\_model().

#### **43.59.3.5 Model & truth\_model () [virtual]**

return the truth sub-model in surrogate models return by reference requires use of dummy objects, but is important to allow use of [assign\\_rep\(\)](#) since this operation must be performed on the original envelope object.

Reimplemented in [DataFitSurrModel](#), [HierarchSurrModel](#), and [RecastModel](#).

References Dakota::dummy\_model, Model::modelRep, and Model::truth\_model().

Referenced by SurrogateModel::force\_rebuild(), SurrBasedMinimizer::initialize\_graphics(), SurrBasedLocalMinimizer::minimize\_surrogates(), SurrBasedGlobalMinimizer::minimize\_surrogates(), SurrBasedMinimizer::print\_results(), SurrogateModel::subordinate\_model(), SurrBasedLocalMinimizer::SurrBasedLocalMinimizer(), RecastModel::truth\_model(), and Model::truth\_model().

#### **43.59.3.6 void update\_from\_subordinate\_model (bool recurse\_flag = true) [virtual]**

propagate vars/labels/bounds/targets from the bottom up used only for instantiate-on-the-fly model recursions (all [RecastModel](#) instantiations and alternate [DataFitSurrModel](#) instantiations). Single, Hierarchical, and Nested Models do not redefine the function since they do not support instantiate-on-the-fly. This means that the recursion will stop as soon as it encounters a [Model](#) that was instantiated normally, which is appropriate since ProblemDescDB-constructed Models use top-down information flow and do not require bottom-up updating.

Reimplemented in [DataFitSurrModel](#), and [RecastModel](#).

References Model::modelRep, and Model::update\_from\_subordinate\_model().

Referenced by NonDLocalReliability::initialize\_class\_data(), NonDExpansion::initialize\_expansion(), Optimizer::initialize\_run(), LeastSq::initialize\_run(), EffGlobalMinimizer::minimize\_surrogates\_on\_model(), NonDGlobalReliability::optimize\_gaussian\_process(), NonDLocalInterval::quantify\_uncertainty(), NonDGlobalInterval::quantify\_uncertainty(), RecastModel::update\_from\_subordinate\_model(), DataFitSurrModel::update\_from\_subordinate\_model(), and Model::update\_from\_subordinate\_model().

**43.59.3.7 Interface & interface () [virtual]**

return the interface employed by the derived model class, if present: [SingleModel::userDefinedInterface](#), [DataFitSurrModel::approxInterface](#), or [NestedModel::optionalInterface](#) return by reference requires use of dummy objects, but is important to allow use of [assign\\_rep\(\)](#) since this operation must be performed on the original envelope object.

Reimplemented in [DataFitSurrModel](#), [NestedModel](#), [RecastModel](#), and [SingleModel](#).

References Dakota::dummy\_interface, Model::interface(), and Model::modelRep.

Referenced by RecastModel::interface(), Model::interface(), and SurrBasedGlobalMinimizer::minimize\_-surrogates().

**43.59.3.8 String local\_eval\_synchronization () [virtual]**

return derived model synchronization setting SingleModels and HierarchSurrModels redefine this virtual function. A default value of "synchronous" prevents asynch local operations for:

- NestedModels: a subIterator can support message passing parallelism, but not asynch local.
- DataFitSurrModels: while asynch evals on approximations will work due to some added bookkeeping, avoiding them is preferable.

Reimplemented in [RecastModel](#), and [SingleModel](#).

References Model::local\_eval\_synchronization(), and Model::modelRep.

Referenced by Model::init\_serial(), RecastModel::local\_eval\_synchronization(), Model::local\_eval\_-synchronization(), and Model::set\_communicators().

**43.59.3.9 int local\_eval\_concurrency () [virtual]**

return derived model asynchronous evaluation concurrency SingleModels and HierarchSurrModels redefine this virtual function.

Reimplemented in [RecastModel](#), and [SingleModel](#).

References Model::local\_eval\_concurrency(), and Model::modelRep.

Referenced by RecastModel::local\_eval\_concurrency(), Model::local\_eval\_concurrency(), and Model::set\_-communicators().

**43.59.3.10 const String & interface\_id () const [virtual]**

return the interface identifier return by reference requires use of dummy objects, but is important to allow use of [assign\\_rep\(\)](#) since this operation must be performed on the original envelope object.

Reimplemented in [DataFitSurrModel](#), [NestedModel](#), [RecastModel](#), and [SingleModel](#).

References Dakota::dummy\_interface, Interface::interface\_id(), Model::interface\_id(), and Model::modelRep.

Referenced by DataFitSurrModel::build\_global(), DataFitSurrModel::DataFitSurrModel(), Model::estimate\_-derivatives(), Model::estimate\_message\_lengths(), SurrBasedLocalMinimizer::find\_center\_approx(),

RecastModel::interface\_id(), Model::interface\_id(), Optimizer::local\_objective\_recast\_retrieve(),  
 SNLLLeastSq::post\_run(), COLINOptimizer::post\_run(), SurrBasedMinimizer::print\_results(),  
 Optimizer::print\_results(), LeastSq::print\_results(), SequentialHybridStrategy::run\_sequential(),  
 DiscrepancyCorrection::search\_db(), Analyzer::update\_best(), SequentialHybridStrategy::update\_local\_-  
 results(), ConcurrentStrategy::update\_local\_results(), and NonDLocalReliability::update\_mpp\_search\_data().

#### **43.59.3.11 bool evaluation\_cache () const [virtual]**

Indicates the usage of an evaluation cache by the [Model](#). Only Models including ApplicationInterfaces support an evaluation cache: surrogate, nested, and recast mappings are not stored in the cache. Possible exceptions: [HierarchSurrModel](#), [NestedModel::optionalInterface](#).

Reimplemented in [SingleModel](#).

References Model::evaluation\_cache(), and Model::modelRep.

Referenced by DataFitSurrModel::DataFitSurrModel(), and Model::evaluation\_cache().

#### **43.59.3.12 ModelList & subordinate\_models (bool recurse\_flag = true)**

return the sub-models in nested and surrogate models since modelList is built with list insertions (using envelope copies), these models may not be used for model.assign\_rep() since this operation must be performed on the original envelope object. They may, however, be used for letter-based operations (including [assign\\_rep\(\)](#) on letter contents such as an interface).

References Model::derived\_subordinate\_models(), Model::modelList, Model::modelRep, and Model::subordinate\_models().

Referenced by NLPQLPOptimizer::initialize(), NCSUOptimizer::initialize(), DOTOptimizer::initialize(), CONMINOptimizer::initialize(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), SOLBase::SOLBase(), Model::subordinate\_models(), and SurrBasedLocalMinimizer::SurrBasedLocalMinimizer().

#### **43.59.3.13 void init\_communicators (const int & max\_iterator\_concurrency, bool recurse\_flag = true)**

allocate communicator partitions for a model and store configuration in modelPCIterMap. The [init\\_communicators\(\)](#) and [derived\\_init\\_communicators\(\)](#) functions are stuctured to avoid performing the messageLengths estimation more than once. [init\\_communicators\(\)](#) (not virtual) performs the estimation and then forwards the results to derived\_init\_communicators (virtual) which uses the data in different contexts.

References ParallelLibrary::bcast\_i(), Model::derived\_init\_communicators(), Model::estimate\_message\_lengths(), ParallelLibrary::increment\_parallel\_configuration(), Model::init\_communicators(), Model::initCommsBcastFlag, Model::messageLengths, Model::modelPCIter, Model::modelPCIterMap, Model::modelRep, ParallelLibrary::parallel\_configuration\_iterator(), and Model::parallelLib.

NonDLocalReliability::method\_recourse(), NonDLocalInterval::method\_recourse(), NonDBayesCalibration::NonDBayesCalibration(), NonDGlobalInterval::NonDGlobalInterval(), NonDGlobalReliability::NonDGlobalReliability(), NonDGPMSSABayesCalibration::NonDGPMSSABayesCalibration(), NonDLHSInterval::NonDLHSInterval(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), NonDPolynomialChaos::NonDPolynomialChaos(), NonDStochCollocation::NonDStochCollocation(), Optimizer::Optimizer(), Model::serve\_configurations(), SNLLOptimizer::SNLLOptimizer(), SurrBasedGlobalMinimizer::SurrBasedGlobalMinimizer(), and SurrBasedLocalMinimizer::SurrBasedLocalMinimizer().

#### 43.59.3.14 void init\_serial()

for cases where [init\\_communicators\(\)](#) will not be called, modify some default settings to behave properly in serial. The [init\\_serial\(\)](#) and [derived\\_init\\_serial\(\)](#) functions are structured to separate base class (common) operations from derived class (specialized) operations.

References Model::asynchEvalFlag, Model::derived\_init\_serial(), Model::init\_serial(), Model::local\_eval\_synchronization(), and Model::modelRep.

Referenced by RecastModel::derived\_init\_serial(), NestedModel::derived\_init\_serial(), HierarchSurrModel::derived\_init\_serial(), DataFitSurrModel::derived\_init\_serial(), and Model::init\_serial().

#### 43.59.3.15 void estimate\_message\_lengths()

estimate messageLengths for a model. This functionality has been pulled out of [init\\_communicators\(\)](#) and defined separately so that it may be used in those cases when messageLengths is needed but model.init\_communicators() is not called, e.g., for the master processor in the self-scheduling of a concurrent iterator strategy.

References Response::active\_set\_derivative\_vector(), Response::copy(), Model::currentResponse, Model::currentVariables, Model::estimate\_message\_lengths(), Model::interface\_id(), Model::messageLengths, Model::modelRep, Model::numFns, Model::parallelLib, MPIPackBuffer::reset(), MPIPackBuffer::size(), and ParallelLibrary::world\_size().

Referenced by ConcurrentStrategy::ConcurrentStrategy(), Model::estimate\_message\_lengths(), and Model::init\_communicators().

#### 43.59.3.16 void assign\_rep (Model \* *model\_rep*, bool *ref\_count\_incr* = true)

replaces existing letter with a new one. Similar to the assignment operator, the [assign\\_rep\(\)](#) function decrements referenceCount for the old modelRep and assigns the new modelRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign\_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref\_count\_incr:

- *ref\_count\_incr* = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.
- *ref\_count\_incr* = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after [get\\_model\(\)](#): a letter is dynamically allocated using new and passed into assign\_rep, the letter's reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

References Dakota::abort\_handler(), Model::modelRep, and Model::referenceCount.

Referenced by NonD::construct\_u\_space\_model(), EffGlobalMinimizer::EffGlobalMinimizer(), LeastSq::LeastSq(), NonDBayesCalibration::NonDBayesCalibration(), NonDGlobalInterval::NonDGlobalInterval(), NonDGlobalReliability::NonDGlobalReliability(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), NonDPolynomialChaos::NonDPolynomialChaos(), NonDStochCollocation::NonDStochCollocation(), Optimizer::Optimizer(), and SurrBasedLocalMinimizer::SurrBasedLocalMinimizer().

#### **43.59.3.17 int derivative\_concurrency () const**

return the gradient concurrency for use in parallel configuration logic This function assumes derivatives with respect to the active continuous variables. Therefore, concurrency with respect to the inactive continuous variables is not captured.

References Dakota::contains(), Model::derivative\_concurrency(), Model::gradIdAnalytic, Model::gradType, Model::hessIdNumerical, Model::hessType, Model::intervalType, Model::methodSrc, Model::modelRep, and Model::numDerivVars.

Referenced by Model::derivative\_concurrency(), HierarchSurrModel::derived\_free\_-communicators(), HierarchSurrModel::derived\_init\_communicators(), DataFitSurrModel::derived\_-init\_communicators(), HierarchSurrModel::derived\_set\_communicators(), NonDExpansion::initialize\_u\_space\_model(), NonDPolynomialChaos::NonDPolynomialChaos(), NonDStochCollocation::NonDStochCollocation(), Iterator::num\_samples(), NonDPolynomialChaos::~NonDPolynomialChaos(), and NonDStochCollocation::~NonDStochCollocation().

#### **43.59.3.18 Real FDstep1 (const Real & *x0\_j*, const Real & *lb\_j*, const Real & *ub\_j*, Real *h\_mag*)**

function returning finite-difference step size (affected by bounds) Auxiliary function to compute forward or first central-difference step size.

References Model::shortStep.

Referenced by Model::estimate\_derivatives().

#### **43.59.3.19 Real FDstep2 (const Real & *x0\_j*, const Real & *lb\_j*, const Real & *ub\_j*, Real *h*)**

function returning second central-difference step size (affected by bounds) Auxiliary function to second central-difference step size, honoring bounds.

References Model::ignoreBounds, and Model::shortStep.

Referenced by Model::estimate\_derivatives().

#### **43.59.3.20 Model \* get\_model (ProblemDescDB & *problem\_db*) [private]**

Used by the envelope to instantiate the correct letter class. Used only by the envelope constructor to initialize modelRep to the appropriate derived type, as given by the modelType attribute.

References ProblemDescDB::get\_string(), Model::model\_type(), and Model::modelType.

Referenced by Model::Model().

**43.59.3.21 int estimate\_derivatives (const ShortArray & map\_asv, const ShortArray & fd\_grad\_asv, const ShortArray & fd\_hess\_asv, const ShortArray & quasi\_hess\_asv, const ActiveSet & original\_set, const bool asynch\_flag) [private]**

evaluate numerical gradients using finite differences. This routine is selected with "method\_source dakota" (the default method\_source) in the numerical gradient specification. Estimate derivatives by computing finite difference gradients, finite difference Hessians, and/or quasi-Newton Hessians. The total number of finite difference evaluations is returned for use by [synchronize\(\)](#) to track response arrays, and it could be used to improve management of max\_function\_evaluations within the iterators.

---

**43.59.3.23 void update\_response (const Variables & vars, Response & new\_response, const ShortArray & fd\_grad\_asv, const ShortArray & fd\_hess\_asv, const ShortArray & quasi\_hess\_asv, const ActiveSet & original\_set, Response & initial\_map\_response, const RealMatrix & new\_fn\_grads, const RealSymMatrixArray & new\_fn\_hessians) [private]**

overlay results to update a response object Overlay the initial\_map\_response with numerically estimated new\_fn\_grads and new\_fn\_hessians to populate new\_response as governed by asv vectors. Quasi-Newton secant Hessian updates are also performed here, since this is where the gradient data needed for the updates is first consolidated. Convenience function used by [estimate\\_derivatives\(\)](#) for the synchronous case and by [synchronize\\_derivatives\(\)](#) for the asynchronous case.

References Response::active\_set\_request\_vector(), Variables::continuous\_variable\_ids(), Response::copy(), Model::currentResponse, Model::currentVariables, ActiveSet::derivative\_vector(), Response::function\_gradients(), Response::function\_hessians(), Response::function\_values(), Model::hessIdQuasi, Model::hessType, Response::is\_null(), Model::numFns, Model::outputLevel, Model::quasiHessians, ActiveSet::request\_vector(), Response::reset\_inactive(), Model::supportsEstimDerivs, Model::surrogate\_response\_mode(), and Model::update\_quasi\_hessians().

Referenced by Model::estimate\_derivatives(), and Model::synchronize\_derivatives().

**43.59.3.24 void update\_quasi\_hessians (const Variables & vars, Response & new\_response, const ActiveSet & original\_set) [private]**

perform quasi-Newton Hessian updates quasi-Newton updates are performed for approximating response function Hessians using BFGS or SR1 formulations. These Hessians are supported only for the active continuous variables, and a check is performed on the DVV prior to invoking the function.

References Dakota::contains(), Variables::continuous\_variables(), Dakota::copy\_data(), Model::fnGradsPrev, Response::function\_gradients(), Model::hessIdQuasi, Model::hessType, Model::modelType, Model::numDerivVars, Model::numFns, Model::numQuasiUpdates, Model::outputLevel, Model::quasiHessians, Model::quasiHessType, ActiveSet::request\_vector(), and Model::xPrev.

Referenced by Model::update\_response().

**43.59.3.25 bool manage\_asv (const ShortArray & asv\_in, ShortArray & map\_asv\_out, ShortArray & fd\_grad\_asv\_out, ShortArray & fd\_hess\_asv\_out, ShortArray & quasi\_hess\_asv\_out) [private]**

Coordinates usage of [estimate\\_derivatives\(\)](#) calls based on asv\_in. Splits asv\_in total request into map\_asv\_out, fd\_grad\_asv\_out, fd\_hess\_asv\_out, and quasi\_hess\_asv\_out as governed by the responses specification. If the returned use\_est\_deriv is true, then these asv outputs are used by [estimate\\_derivatives\(\)](#) for the initial map, finite difference gradient evals, finite difference Hessian evals, and quasi-Hessian updates, respectively. If the returned use\_est\_deriv is false, then only map\_asv\_out is used.

References Dakota::abort\_handler(), Dakota::contains(), Model::gradIdAnalytic, Model::gradIdNumerical, Model::gradType, Model::hessIdAnalytic, Model::hessIdNumerical, Model::hessIdQuasi, Model::hessType, Model::intervalType, Model::methodSrc, Model::supportsEstimDerivs, and Model::surrogate\_response\_mode().

Referenced by Model::asynch\_compute\_response(), and Model::compute\_response().

*The total size that has been allocated for the buffer.*

### 43.60.1 Detailed Description

Class for packing MPI message buffers. A class that provides a facility for packing message buffers using the MPI\_Pack facility. The [MPIPackBuffer](#) class dynamically resizes the internal buffer to contain enough memory to pack the entire object. When deleted, the [MPIPackBuffer](#) object deletes this internal buffer. This class is based on the Dakota\_Version\_3\_0 version of utilib::PackBuffer from utilib/src/io/PackBuf.[cpp,h]

The documentation for this class was generated from the following files:

- [MPIPackBuffer.H](#)
- [MPIPackBuffer.C](#)

## 43.61 MPIUnpackBuffer Class Reference

Class for unpacking MPI message buffers.

### Public Member Functions

### 43.62.1 Detailed Description

Wrapper class for the NCSU DIRECT optimization library. The [NCSUOptimizer](#) class provides a wrapper for a Fortran 77 implementation of the DIRECT algorithm developed at North Carolina State University. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows:

### 43.62.2 Constructor & Destructor Documentation

#### 43.62.2.1 NCSUOptimizer (*Model & model*)

standard constructor This is the standard constructor with method specification support.

References [NCSUOptimizer::check\\_inputs\(\)](#), and [NCSUOptimizer::initialize\(\)](#).

#### 43.62.2.2 NCSUOptimizer (*Model & model, const int & max\_iter, const int & max\_eval, double min\_box\_size = -1., double vol\_box\_size = -1., double solution\_target = -DBL\_MAX*)

alternate constructor for instantiations "on the fly" This is an alternate constructor for instantiations on the fly using a [Model](#) but no [ProblemDescDB](#).

References [NCSUOptimizer::check\\_inputs\(\)](#), [NCSUOptimizer::initialize\(\)](#), [Iterator::maxFunctionEvals](#), and [Iterator::maxIterations](#).

#### 43.62.2.3 NCSUOptimizer ([NoDBBaseConstructor](#), *Model & model*)

alternate constructor for [Iterator](#) instantiations by name This is an alternate constructor for [Iterator](#) instantiations by name using a [Model](#) but no [ProblemDescDB](#).

References [NCSUOptimizer::check\\_inputs\(\)](#), and [NCSUOptimizer::initialize\(\)](#).

#### 43.62.2.4 NCSUOptimizer (*const RealVector & var\_l\_bnds, const RealVector & var\_u\_bnds, const int & max\_iter, const int & max\_eval, double(\*)(const RealVector &x) user\_obj\_eval, double min\_box\_size = -1., double vol\_box\_size = -1., double solution\_target = -DBL\_MAX*)

alternate constructor for instantiations "on the fly" This is an alternate constructor for performing an optimization using the passed in objective function pointer.

References [NCSUOptimizer::check\\_inputs\(\)](#), [Iterator::maxFunctionEvals](#), and [Iterator::maxIterations](#).

### 43.62.3 Member Function Documentation

**43.62.3.1 int objective\_eval (int \**n*, double *c*[ ], double *l*[ ], double *u*[ ], int *point*[ ], int \**maxI*, int \**start*, int \**maxfunc*, double *fvec*[ ], int *iidata*[ ], int \**iisize*, double *ddata*[ ], int \**idsize*, char *cdata*[ ], int \**icsize*) [static, private]**

'fep' in Griffin-modified NCSUDirect: computes the value of the objective function (potentially at multiple points, passed by function pointer to NCSUDirect). Include unscaling from DIRECT. Modified batch evaluator that accepts multiple points and returns corresponding vector of functions in fvec. Must be used with modified DIRECT src (DIRbatch.f).

### 43.63.1 Detailed Description

Derived model class which performs a complete sub-iterator execution within every evaluation of the model. The [NestedModel](#) class nests a sub-iterator execution within every model evaluation. This capability is most commonly used for optimization under uncertainty, in which a nondeterministic iterator is executed on every optimization function evaluation. The [NestedModel](#) also contains an optional interface, for portions of the model evaluation which are independent from the sub-iterator, and a set of mappings for combining sub-iterator and optional interface data into a top level response for the model.

### 43.63.2 Member Function Documentation

#### 43.63.2.1 void derived\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [compute\\_response\(\)](#) specific to [NestedModel](#) Update subModel's inactive variables with active variables from currentVariables, compute the optional interface and sub-iterator responses, and map these to the total model response.

Reimplemented from [Model](#).

References Response::active\_set(), NestedModel::component\_parallel\_mode(), Model::currentResponse, Model::currentVariables, Interface::map(), NestedModel::nestedModelEvalCntr, NestedModel::optInterfaceResponse, NestedModel::optionalInterface, NestedModel::response\_mapping(), Iterator::response\_results(), Iterator::response\_results\_active\_set(), Iterator::run\_iterator(), NestedModel::set\_mapping(), NestedModel::subIterator, and NestedModel::update\_sub\_model().

#### 43.63.2.2 void derived\_asynch\_compute\_response (const ActiveSet & set) [protected, virtual]

portion of [asynch\\_compute\\_response\(\)](#) specific to [NestedModel](#) Not currently supported by NestedModels (need to add concurrent iterator support). As a result, [derived\\_synchronize\(\)](#) and [derived\\_synchronize\\_nowait\(\)](#) are inactive as well).

Reimplemented from [Model](#).

References Dakota::abort\_handler(), Response::active\_set(), Model::currentResponse, Model::currentVariables, Interface::map(), NestedModel::nestedModelEvalCntr, NestedModel::optInterfaceResponse, NestedModel::optionalInterface, and NestedModel::set\_mapping().

#### **43.63.2.3 bool derived\_master\_overload () const [inline, protected, virtual]**

flag which prevents overloading the master with a multiprocessor evaluation (forwarded to optionalInterface) Derived master overload for subModel is handled separately in subModel.compute\_response() within subIterator.run().

Reimplemented from [Model](#).

References Interface::iterator\_eval\_dedicated\_master\_flag(), Interface::multi\_proc\_eval\_flag(), NestedModel::optInterfacePointer, and NestedModel::optionalInterface.

#### **43.63.2.4 void derived\_init\_communicators (const int & max\_iterator\_concurrency, bool recurse\_flag = true) [inline, protected, virtual]**

set up optionalInterface and subModel for parallel operations Asynchronous flags need to be initialized for the subModel. In addition, max\_iterator\_concurrency is the outer level iterator concurrency, not the subIterator concurrency that subModel will see, and recomputing the message\_lengths on the subModel is probably not a bad idea either. Therefore, recompute everything on subModel using [init\\_communicators\(\)](#).

Reimplemented from [Model](#).

References Model::init\_communicators(), Interface::init\_communicators(), Iterator::maximum\_concurrency(), Model::messageLengths, NestedModel::optInterfacePointer, NestedModel::optionalInterface, NestedModel::subIterator, and NestedModel::subModel.

#### **43.63.2.5 int evaluation\_id () const [inline, protected, virtual]**

Return the current evaluation id for the [NestedModel](#). return the top level nested evaluation count. To get the lower level eval count, the subModel must be explicitly queried. This is consistent with the eval counter definitions in surrogate models.

Reimplemented from [Model](#).

References NestedModel::nestedModelEvalCntr.

#### **43.63.2.6 size\_t cv\_index\_map (size\_t cv\_index) [private]**

offset cv\_index to create index into aggregated primary/secondary arrays maps index within active continuous variables to index within aggregated active continuous/discrete-int/discrete-real variables.

References Model::currentVariables, Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

**43.63.2.7 size\_t div\_index\_map (size\_t *div\_index*) [private]**

offset *div\_index* to create index into aggregated primary/secondary arrays maps index within active discrete int variables to index within aggregated active continuous/discrete-int/discrete-real variables.

References Model::currentVariables, Variables::cv(), Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

**43.63.2.8 size\_t drv\_index\_map (size\_t *drv\_index*) [private]**

offset *drv\_index* to create index into aggregated primary/secondary arrays maps index within active discrete real variables to index within aggregated active continuous/discrete-int/discrete-real variables.

References Model::currentVariables, Variables::cv(), Variables::div(), Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

**43.63.2.9 size\_t ccv\_index\_map (size\_t *ccv\_index*) [private]**

offset active complement *ccv\_index* to create index into all continuous arrays maps index within complement of active continuous variables to index within all continuous variables.

References Dakota::abort\_handler(), Model::currentVariables, Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

**43.63.2.10 size\_t cdiv\_index\_map (size\_t *cdiv\_index*) [private]**

offset active complement *cdiv\_index* to create index into all discrete int arrays maps index within complement of active discrete int variables to index within all discrete int variables.

References Dakota::abort\_handler(), Model::currentVariables, Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

**43.63.2.11 size\_t cdrv\_index\_map (size\_t *cdrv\_index*) [private]**

offset active complement *cdrv\_index* to create index into all discrete real arrays maps index within complement of active discrete real variables to index within all discrete real variables.

References Dakota::abort\_handler(), Model::currentVariables, Variables::variables\_components\_totals(), and Variables::view().

Referenced by NestedModel::NestedModel(), and NestedModel::update\_sub\_model().

### 43.63.2.12 void response\_mapping (const Response & *opt\_interface\_response*, const Response & *sub\_iterator\_response*, Response & *mapped\_response*) [private]

combine the response from the optional interface evaluation with the response from the sub-iteration using the primaryCoeffs/secondaryCoeffs mappings to create the total response for the model In the OUU case,

```
optionalInterface fns = {f}, {g} (deterministic primary functions, constraints)
subIterator fns = {S} (UQ response statistics)
```

Problem formulation for mapped functions:

```
minimize {f} + [W]{S}
subject to {g_l} <= {g} <= {g_u}
 {a_l} <= [A]{S} <= {a_u}
 {g} == {g_t}
 [A]{S} == {a_t}
```

where [W] is the primary\_mapping\_matrix user input (primaryRespCoeffs class attribute), [A] is the secondary\_mapping\_matrix user input (secondaryRespCoeffs class attribute), {{g\_l},{a\_l}} are the top level inequality constraint lower bounds, {{g\_u},{a\_u}} are the top level inequality constraint upper bounds, and {{g\_t},{a\_t}} are the top level equality constraint targets.

NOTE: optionalInterface/subIterator primary fns (obj/lsq/generic fns) overlap but optionalInterface/subIterator secondary fns (ineq/eq constraints) do not. The [W] matrix can be specified so as to allow

- some purely deterministic primary functions and some combined: [W] filled and [W].num\_rows() < {f}.length() [combined first] or [W].num\_rows() == {f}.length() and [W] contains rows of zeros [combined last]
- some combined and some purely stochastic primary functions: [W] filled and [W].num\_rows() > {f}.length()
- separate deterministic and stochastic primary functions: [W].num\_rows() > {f}.length() and [W] contains {f}.length() rows of zeros.

If the need arises, could change constraint definition to allow overlap as well:  $\{g_l\} \leq \{g\} + [A]\{S\} \leq \{g_u\}$  with [A] usage the same as for [W] above.

In the UOO case, things are simpler, just compute statistics of each optimization response function: [W] = [I], {f}/{g}/{A} are empty.

References Dakota::abort\_handler(), Response::active\_set\_derivative\_vector(), Response::active\_set\_request\_vector(), Dakota::copy\_data(), Response::function\_gradient(), Response::function\_gradient\_view(), Response::function\_gradients(), Response::function\_hessian(), Response::function\_hessian\_view(), Response::function\_hessians(), Response::function\_value(), Response::function\_values(), Response::function\_values\_view(), Response::num\_functions(), NestedModel::numOptInterfEqCon, NestedModel::numOptInterfIneqCon, NestedModel::numOptInterfPrimary, NestedModel::numSubIterFns, NestedModel::numSubIterMappedEqCon, NestedModel::numSubIterMappedIneqCon, NestedModel::optInterfacePointer, NestedModel::primaryRespCoeffs, Response::reset\_inactive(), and NestedModel::secondaryRespCoeffs.

Referenced by NestedModel::derived\_compute\_response().

### 43.63.3 Member Data Documentation

#### 43.63.3.1 Model subModel [private]

the sub-model used in sub-iterator evaluations There are no restrictions on subModel, so arbitrary nestings are possible. This is commonly used to support surrogate-based optimization under uncertainty by having NestedModels contain SurrogateModels and vice versa.

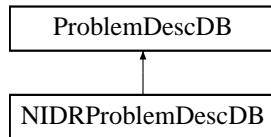

Referenced by NestedModel::component\_parallel\_mode(), NestedModel::derived\_free\_communicators(), NestedModel::derived\_init\_communicators(), NestedModel::derived\_init\_serial(), NestedModel::derived\_set\_communicators(), NestedModel::derived\_subordinate\_models(), NestedModel::fine\_grained\_evaluation\_counters(), NestedModel::integer\_variable\_mapping(), NestedModel::NestedModel(), NestedModel::print\_evaluation\_summary(), NestedModel::real\_variable\_mapping(), NestedModel::resolve\_integer\_variable\_mapping(), NestedModel::resolve\_real\_variable\_mapping(), NestedModel::serve(), NestedModel::set\_mapping(), NestedModel::sm\_acv\_index\_map(), NestedModel::sm\_adiv\_index\_map(), NestedModel::subordinate\_model(), NestedModel::surrogate\_response\_mode(), NestedModel::update\_inactive\_view(), and NestedModel::update\_sub\_model().

### 43.64.1 Detailed Description

The derived input file database utilizing the new IDR parser. The [NIDRProblemDescDB](#) class is derived from [ProblemDescDB](#) for use by the NIDR parser in processing DAKOTA input file data. For information on modifying the NIDR input parsing procedures, refer to Dakota/docs/Dev\_Spec\_Change.dox. For more on the parsing technology, see "Specifying and Reading Program Input with NIDR" by David M. Gay (report SAND2008-2261P, which is available in PDF form as <http://www.sandia.gov/~dmgay/nidr08.pdf>). Source for the routines declared herein is NIDRProblemDescDB.C, in which most routines are so short that a description seems unnecessary.

## 43.64.2 Member Function Documentation

### 43.64.2.1 void derived\_parse\_inputs (const char \* *dakota\_input\_file*, const char \* *parser\_options*) [virtual]

parses the input file and populates the problem description database using NIDR. Parse the input file using the Input Deck Reader (IDR) parsing system. IDR populates the IDRProblemDescDB object with the input file data.

Reimplemented from [ProblemDescDB](#).

References Dakota::abort\_handler(), ProblemDescDB::dataInterfaceList, ProblemDescDB::dataMethodList, DataMethodRep::dIDetails, DataMethodRep::dILib, ProblemDescDB::parallel\_library(), and NIDRProblemDescDB::pDDBInstance.

### 43.66.1 Detailed Description

Wrapper class for the NL2SOL nonlinear least squares library. The `NL2SOLLeastSq` class provides a wrapper for NL2SOL (TOMS Algorithm 573), in the updated form of Port Library routines dn[fg][b] from Bell Labs; see <http://www.netlib.org/port/readme>. The Fortran from Port has been turned into C by f2c. NL2SOL uses a function pointer approach for which passed functions must be either global functions or static member functions.

### 43.66.2 Member Function Documentation

#### 43.66.2.1 void minimize\_residuals () [virtual]

Used within the least squares branch for minimizing the sum of squares residuals. Redefines the run virtual function for the least squares branch.

Details on the following subscript values appear in "Usage Summary for Selected Optimization Routines" by David M. Gay, Computing Science Technical Report No. 153, AT&T Bell Laboratories, 1990. <http://netlib.bell-labs.com/cm/cs/cstr/153.ps.gz>

Implements `LeastSq`.

## 43.67 NLPQLPOptimizer Class Reference

Wrapper class for the NLPQLP optimization library, Version 2.0. Inheritance diagram for NLPQLPOptimizer::

### Public Member Functions

- `NLPQLPOptimizer (Model &model)`  
*standard constructor*
- `NLPQLPOptimizer (NoDBBaseConstructor, Model &model)`  
*alternate constructor*
- `~NLPQLPOptimizer ()`  
*destructor*
- `void find_optimum ()`  
*Used within the optimizer branch for computing the optimal solution. Redefines the run virtual function for the optimizer branch.*

### Protected Member Functions

- `void initialize_run ()`  
*performs run-time set up*

### Private Member Functions

- `void initialize ()`  
*Shared constructor code.*
- `void allocate_workspace ()`  
*Allocates workspace for the optimizer.*

- void `deallocate_workspace ()`  
*Releases workspace memory.*
- void `allocate_constraints ()`  
*Allocates constraint mappings.*

## Private Attributes

- int `L`  
*L : Number of parallel systems, i.e. function calls during line search at predetermined iterates. HINT: If only less than 10 parallel function evaluations are possible, it is recommended to apply the serial version by setting L=1.*
- int `numEqConstraints`  
*numEqConstraints : Number of equality constraints.*
- int `MMAX`  
*MMAX : Row dimension of array DG containing Jacobian of constraints. MMAX must be at least one and greater or equal to M.*
- int `N`  
*N : Number of optimization variables.*
- int `NMAX`  
*NMAX : Row dimension of C. NMAX must be at least two and greater than N.*
- int `MNN2`  
*MNN2 : Must be equal to M+N+N+2.*
- double \* `X`  
*X(NMAX,L) : Initially, the first column of X has to contain starting values for the optimal solution. On return, X is replaced by the current iterate. In the driving program the row dimension of X has to be equal to NMAX. X is used internally to store L different arguments for which function values should be computed simultaneously.*
- double \* `F`  
*F(L) : On return, F(1) contains the final objective function value. F is used also to store L different objective function values to be computed from L iterates stored in X.*
- double \* `G`  
*G(MMAX,L) : On return, the first column of G contains the constraint function values at the final iterate X. In the driving program the row dimension of G has to be equal to MMAX. G is used internally to store L different set of constraint function values to be computed from L iterates stored in X.*
- double \* `DF`  
*DF(NMAX) : DF contains the current gradient of the objective function. In case of numerical differentiation and a distributed system (L>1), it is recommended to apply parallel evaluations of F to compute DF.*

- double \* [DG](#)

*DG(MMAX,NMAX) : DG contains the gradients of the active constraints (*ACTIVE(J)=.true.*) at a current iterate X. The remaining rows are filled with previously computed gradients. In the driving program the row dimension of DG has to be equal to MMAX.*

- double \* [U](#)

*U(MNN2) : U contains the multipliers with respect to the actual iterate stored in the first column of X. The first M locations contain the multipliers of the M nonlinear constraints, the subsequent N locations the multipliers of the lower bounds, and the final N locations the multipliers of the upper bounds. At an optimal solution, all multipliers with respect to inequality constraints should be nonnegative.*

- double \* [C](#)

*C(NMAX,NMAX) : On return, C contains the last computed approximation of the Hessian matrix of the Lagrangian function stored in form of an LDL decomposition. C contains the lower triangular factor of an LDL factorization of the final quasi-Newton matrix (without diagonal elements, which are always one). In the driving program, the row dimension of C has to be equal to NMAX.*

- double \* [D](#)

*D(NMAX) : The elements of the diagonal matrix of the LDL decomposition of the quasi-Newton matrix are stored in the one-dimensional array D.*

- double [ACC](#)

*ACC : The user has to specify the desired final accuracy (e.g. 1.0D-7). The termination accuracy should not be smaller than the accuracy by which gradients are computed.*

- double [ACCQP](#)

*ACCQP : The tolerance is needed for the QP solver to perform several tests, for example whether optimality conditions are satisfied or whether a number is considered as zero or not. If ACCQP is less or equal to zero, then the machine precision is computed by NLPQLP and subsequently multiplied by 1.0D+4.*

- double [STPMIN](#)

*STPMIN : Minimum steplength in case of L>1. Recommended is any value in the order of the accuracy by which functions are computed. The value is needed to compute a steplength reduction factor by STPMIN\*\*( $1/L-1$ ). If STPMIN<=0, then STPMIN=ACC is used.*

- int [MAXFUN](#)

*MAXFUN : The integer variable defines an upper bound for the number of function calls during the line search (e.g. 20). MAXFUN is only needed in case of L=1, and must not be greater than 50.*

- int [MAXIT](#)

*MAXIT : Maximum number of outer iterations, where one iteration corresponds to one formulation and solution of the quadratic programming subproblem, or, alternatively, one evaluation of gradients (e.g. 100).*

- int [MAX\\_NM](#)

*MAX\_NM : Stack size for storing merit function values at previous iterations for non-monotone line search (e.g. 10). In case of MAX\_NM=0, monotone line search is performed.*

- double [TOL\\_NM](#)

*TOL\_NM* : Relative bound for increase of merit function value, if line search is not successful during the very first step. Must be non-negative (e.g. 0.1).

- int **IPRINT**

*IPRINT* : Specification of the desired output level. *IPRINT* = 0 : No output of the program. *IPRINT* = 1 : Only a final convergence analysis is given. *IPRINT* = 2 : One line of intermediate results is printed in each iteration. *IPRINT* = 3 : More detailed information is printed in each iteration step, e.g. variable, constraint and multiplier values. *IPRINT* = 4 : In addition to '*IPRINT*=3', merit function and steplength values are displayed during the line search.

- int **MODE**

*MODE* : The parameter specifies the desired version of NLPQLP. *MODE* = 0 : Normal execution (reverse communication!). *MODE* = 1 : The user wants to provide an initial guess for the multipliers in U and for the Hessian of the Lagrangian function in C and D in form of an LDL decomposition.

- int **IOUT**

*IOUT* : Integer indicating the desired output unit number, i.e. all write-statements start with 'WRITE(*IOUT*,...)'.

- int **IFAIL**

*IFAIL* : The parameter shows the reason for terminating a solution process. Initially *IFAIL* must be set to zero. On return *IFAIL* could contain the following values: *IFAIL* = -2 : Compute gradient values w.r.t. the variables stored in first column of X, and store them in DF and DG. Only derivatives for active constraints ACTIVE(J)=.TRUE. need to be computed. Then call NLPQLP again, see below. *IFAIL* = -1 : Compute objective fn and all constraint values subject the variables found in the first L columns of X, and store them in F and G. Then call NLPQLP again, see below. *IFAIL* = 0 : The optimality conditions are satisfied. *IFAIL* = 1 : The algorithm has been stopped after MAXIT iterations. *IFAIL* = 2 : The algorithm computed an uphill search direction. *IFAIL* = 3 : Underflow occurred when determining a new approximation matrix for the Hessian of the Lagrangian. *IFAIL* = 4 : The line search could not be terminated successfully. *IFAIL* = 5 : Length of a working array is too short. More detailed error information is obtained with '*IPRINT*>0'. *IFAIL* = 6 : There are false dimensions, for example M>MAXM, N>=NMAX, or MN2<>M+N+N+2. *IFAIL* = 7 : The search direction is close to zero, but the current iterate is still infeasible. *IFAIL* = 8 : The starting point violates a lower or upper bound. *IFAIL* = 9 : Wrong input parameter, i.e., *MODE*, LDL decomposition in D and C (in case of *MODE*=1), *IPRINT*, *IOUT*. *IFAIL* = 10 : Internal inconsistency of the quadratic subproblem, division by zero. *IFAIL* > 100 : The solution of the quadratic programming subproblem has been terminated with an error message and *IFAIL* is set to *IFQL*+100, where *IFQL* denotes the index of an inconsistent constraint.

- double \* **WA**

*WA(LWA)* : *WA* is a real working array of length *LWA*.

- int **LWA**

*LWA* : *LWA* value extracted from NLPQLP20.f.

- int \* **KWA**

*KWA(LKWA)* : The user has to provide working space for an integer array.

- int **LKWA**

*LKWA* : *LKWA* should be at least *N*+10.

- int \* **ACTIVE**

*ACTIVE(LACTIV) : The logical array shows a user the constraints, which NLPQLP considers to be active at the last computed iterate, i.e.  $G(J,X)$  is active, if and only if  $ACTIVE(J)=.TRUE., J=1,...,M.$*

- int **LACTIVE**

*LACTIV : The length LACTIV of the logical array should be at least  $2*M+10.$*

- int **LQL**

*LQL : If LQL = .TRUE., the quadratic programming subproblem is to be solved with a full positive definite quasi-Newton matrix. Otherwise, a Cholesky decomposition is performed and updated, so that the subproblem matrix contains only an upper triangular factor.*

- int **numNlpqlConstr**

*total number of constraints seen by NLPQL*

- SizetList **nonlinIneqConMappingIndices**

*a list of indices for referencing the DAKOTA nonlinear inequality constraints used in computing the corresponding NLPQL constraints.*

- RealList **nonlinIneqConMappingMultipliers**

*a list of multipliers for mapping the DAKOTA nonlinear inequality constraints to the corresponding NLPQL constraints.*

- RealList **nonlinIneqConMappingOffsets**

*a list of offsets for mapping the DAKOTA nonlinear inequality constraints to the corresponding NLPQL constraints.*

- SizetList **linIneqConMappingIndices**

*a list of indices for referencing the DAKOTA linear inequality constraints used in computing the corresponding NLPQL constraints.*

- RealList **linIneqConMappingMultipliers**

*a list of multipliers for mapping the DAKOTA linear inequality constraints to the corresponding NLPQL constraints.*

- RealList **linIneqConMappingOffsets**

*a list of offsets for mapping the DAKOTA linear inequality constraints to the corresponding NLPQL constraints.*

### 43.67.1 Detailed Description

Wrapper class for the NLPQLP optimization library, Version 2.0. \*\*\*\*\*

AN IMPLEMENTATION OF A SEQUENTIAL QUADRATIC PROGRAMMING METHOD FOR SOLVING  
NONLINEAR OPTIMIZATION PROBLEMS BY DISTRIBUTED COMPUTING AND NON-MONOTONE  
LINE SEARCH

This subroutine solves the general nonlinear programming problem

minimize  $F(X)$  subject to  $G(J,X) = 0, J=1,...,ME$   $G(J,X) \geq 0, J=ME+1,...,M$   $XL \leq X \leq XU$

and is an extension of the code NLPQLD. NLPQLP is specifically tuned to run under distributed systems. A new input parameter L is introduced for the number of parallel computers, that is the number of function calls to be

executed simultaneously. In case of L=1, NLPQLP is identical to NLPQLD. Otherwise the line search is modified to allow L parallel function calls in advance. Moreover the user has the opportunity to used distributed function calls for evaluating gradients.

The algorithm is a modification of the method of Wilson, Han, and Powell. In each iteration step, a linearly constrained quadratic programming problem is formulated by approximating the Lagrangian function quadratically and by linearizing the constraints. Subsequently, a one-dimensional line search is performed with respect to an augmented Lagrangian merit function to obtain a new iterate. Also the modified line search algorithm guarantees convergence under the same assumptions as before.

For the new version, a non-monotone line search is implemented which allows to increase the merit function in case of instabilities, for example caused by round-off errors, errors in gradient approximations, etc.

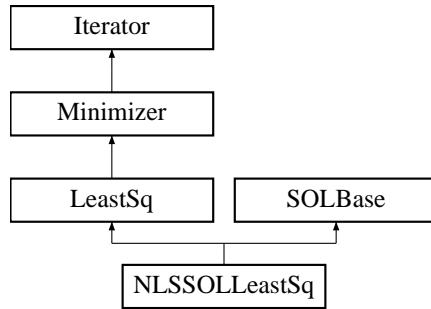

The subroutine contains the option to predetermine initial guesses for the multipliers or the Hessian of the Lagrangian function and is called by reverse communication.

The documentation for this class was generated from the following files:

- NLPQLPOptimizer.H
- NLPQLPOptimizer.C

## 43.68 NLSSOLLeastSq Class Reference

### Static Private Attributes

- static [NLSSOLLeastSq \\* nlssolInstance](#)  
*pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data*

### 43.68.1 Detailed Description

Wrapper class for the NLSSOL nonlinear least squares library. The [NLSSOLLeastSq](#) class provides a wrapper for NLSSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any nonstatic attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: `max_function_evaluations` is implemented directly in NLSSOLLeastSq's evaluator functions since there is no NLSSOL parameter equivalent, and `max_iterations`, `convergence_tolerance`, `output_verbosity`, `verify_level`, `function_precision`, and `linesearch_tolerance` are mapped into NLSSOL's "Major Iteration Limit", "Optimality Tolerance", "Major Print Level" (`verbose`: Major Print Level = 20; `quiet`: Major Print Level = 10), "Verify Level", "Function Precision", and "Linesearch Tolerance" parameters, respectively, using NLSSOL's `npoptn()` subroutine (as wrapped by `npoptn2()` from the `npoptn_wrapper.f` file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NLSSOL's optional input parameters and the `npoptn()` subroutine.

### 43.68.2 Constructor & Destructor Documentation

#### 43.68.2.1 NLSSOLLeastSq (Model & *model*)

standard constructor This is the primary constructor. It accepts a [Model](#) reference.

References [Minimizer::constraintTol](#), [Iterator::convergenceTol](#), [Iterator::fdGradStepSize](#), [ProblemDescDB::get\\_int\(\)](#), [ProblemDescDB::get\\_real\(\)](#), [Iterator::gradientType](#), [Iterator::maxIterations](#), [Iterator::outputLevel](#), [Iterator::probDescDB](#), [SOLBase::set\\_options\(\)](#), [Minimizer::speculativeFlag](#), and [Minimizer::vendorNumericalGradFlag](#).

#### 43.68.2.2 NLSSOLLeastSq (NoDBBaseConstructor, Model & *model*)

alternate constructor This is an alternate constructor which accepts a [Model](#) but does not have a supporting method specification from the [ProblemDescDB](#).

References [Minimizer::constraintTol](#), [Iterator::convergenceTol](#), [Iterator::fdGradStepSize](#), [Iterator::gradientType](#), [Iterator::maxIterations](#), [Iterator::outputLevel](#), [SOLBase::set\\_options\(\)](#), [Minimizer::speculativeFlag](#), and [Minimizer::vendorNumericalGradFlag](#).

The documentation for this class was generated from the following files:

- [NLSSOLLeastSq.H](#)
- [NLSSOLLeastSq.C](#)

## 43.69 NoDBBaseConstructor Struct Reference

Dummy struct for overloading constructors used in on-the-fly instantiations.

### Public Member Functions

- [NoDBBaseConstructor \(int=0\)](#)

*C++ structs can have constructors.*

### 43.69.1 Detailed Description

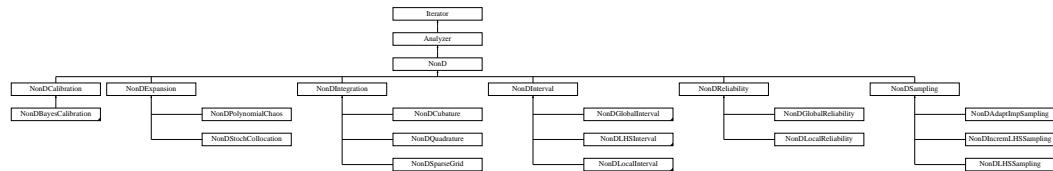

Dummy struct for overloading constructors used in on-the-fly instantiations. [NoDBBaseConstructor](#) is used to overload the constructor used for on-the-fly instantiations in which [ProblemDescDB](#) queries cannot be used. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- `global_defs.h`

## 43.70 NonD Class Reference

Base class for all nondeterministic iterators (the DAKOTA/UQ branch). Inheritance diagram for NonD::

### Public Member Functions

- void [initialize\\_random\\_variables](#) (short u\_space\_type)  
*initialize natafTransform based on distribution data from iteratedModel*
- void [initialize\\_random\\_variables](#) (const Pecos::ProbabilityTransformation &transform)  
*alternate form: initialize natafTransform based on incoming data*
- void [requested\\_levels](#) (const RealVectorArray &req\_resp\_levels, const RealVectorArray &req\_prob\_levels, const RealVectorArray &req\_rel\_levels, const RealVectorArray &req\_gen\_rel\_levels, short resp\_level\_target, bool cdf\_flag)  
*set requestedRespLevels, requestedProbLevels, requestedRelLevels, requestedGenRelLevels, respLevelTarget, and cdfFlag (used in combination with alternate ctors)*
- void [distribution\\_parameter\\_derivatives](#) (bool dist\_param\_derivs)  
*set distParamDerivs*
- bool [pdf\\_output](#) () const  
*get pdfOutput*
- void [pdf\\_output](#) (bool output)  
*set pdfOutput*
- Pecos::ProbabilityTransformation & [variable\\_transformation](#) ()  
*return natafTransform*

### Protected Member Functions

- [NonD \(Model &model\)](#)  
*constructor*
- [NonD \(NoDBBaseConstructor, Model &model\)](#)  
*alternate constructor for sample generation and evaluation "on the fly"*

- `NonD (NoDBBaseConstructor, const RealVector &lower_bnds, const RealVector &upper_bnds)`  
*alternate constructor for sample generation "on the fly"*
- `~NonD ()`  
*destructor*
- `void initialize_run ()`

*total number of uncertain variables (native space)*
- `RealVectorArray requestedRespLevels`  
*requested response levels for all response functions*
- `RealVectorArray computedProbLevels`  
*output probability levels for all response functions resulting from requestedRespLevels*
- `RealVectorArray computedRelLevels`  
*output reliability levels for all response functions resulting from requestedRespLevels*
- `RealVectorArray computedGenRelLevels`  
*output generalized reliability levels for all response functions resulting from requestedRespLevels*
- `short respLevelTarget`  
*indicates mapping of z->p (PROBABILITIES), z->beta (RELIABILITIES), or z->beta\* (GEN\_RELIABILITIES)*
- `RealVectorArray requestedProbLevels`  
*requested probability levels for all response functions*
- `RealVectorArray requestedRelLevels`  
*requested reliability levels for all response functions*
- `RealVectorArray requestedGenRelLevels`  
*requested generalized reliability levels for all response functions*
- `RealVectorArray computedRespLevels`  
*output response levels for all response functions resulting from requestedProbLevels, requestedRelLevels, or requestedGenRelLevels*
- `size_t totalLevelRequests`  
*total number of levels specified within requestedRespLevels, requestedProbLevels, and requestedRelLevels*
- `bool cdfFlag`  
*flag for type of probabilities/reliabilities used in mappings: cumulative/CDF (true) or complementary/CCDF (false)*

- bool `pdfOutput`

*flag for managing output of response probability density functions (PDFs)*

- Response `finalStatistics`

*final statistics from the uncertainty propagation used in strategies: response means, standard deviations, and probabilities of failure*

## Static Protected Attributes

- static NonD \* `nondInstance`

*pointer to the active object instance used within static evaluator functions in order to avoid the need for static data*

## Private Member Functions

- void `distribute_levels` (RealVectorArray &`levels`, bool `ascending=true`)

*convenience function for distributing a vector of levels among multiple response functions if a short-hand specification is employed.*

## Private Attributes

- bool `distParamDerivs`

*flags calculation of derivatives with respect to distribution parameters s within `resp_x_to_u_mapping()` using the chain rule  $df/dx \ dx/ds$ . The default is to calculate derivatives with respect to standard random variables u using the chain rule  $df/dx \ dx/du$ .*

### 43.70.1 Detailed Description

Base class for all nondeterministic iterators (the DAKOTA/UQ branch). The base class for nondeterministic iterators consolidates uncertain variable data and probabilistic utilities for inherited classes.

### 43.70.2 Member Function Documentation

#### 43.70.2.1 void `initialize_random_variables` (short `u_space_type`)

initialize natafTransform based on distribution data from iteratedModel Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the `Model` variables are in x-space.

References      `NonD::initialize_random_variable_correlations()`,      `NonD::initialize_random_variable_parameters()`, `NonD::initialize_random_variable_transformation()`, `NonD::initialize_random_variable_types()`, `NonD::natafTransform`, and `NonD::verify_correlation_support()`.

Referenced by NonDExpansion::compute\_statistics(), NonDGlobalReliability::importance\_sampling(), NonDLocalReliability::initialize\_class\_data(), NonDExpansion::initialize\_expansion(), NonDAdaptImpSampling::NonDAdaptImpSampling(), and NonDGlobalReliability::optimize\_gaussian\_process().

#### 43.70.2.2 void initialize\_random\_variables (const Pecos::ProbabilityTransformation & transform)

alternate form: initialize natafTransform based on incoming data This function is commonly used to publish transformation data when the Model variables are in a transformed space (e.g., u-space) and ProbabilityTransformation::ranVarTypes et al. may not be generated directly. This allows for the use of inverse transformations to return the transformed space variables to their original states.

References NonD::initialize\_random\_variable\_transformation(), NonD::natafTransform, NonD::numContDesVars, and NonD::numContStateVars.

#### 43.70.2.3 void initialize\_run () [inline, protected, virtual]

utility function to perform common operations prior to [pre\\_run\(\)](#); typically memory initialization; setting of instance pointers Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [initialize\\_run\(\)](#), typically \_before\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References NonD::nondInstance, and NonD::prevNondInstance.

#### 43.70.2.4 void run () [inline, protected, virtual]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References Analyzer::bestVarsRespMap, and NonD::quantify\_uncertainty().

#### 43.70.2.5 void finalize\_run () [inline, protected, virtual]

utility function to perform common operations following [post\\_run\(\)](#); deallocation and resetting of instance pointers Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [finalize\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References NonD::nondInstance, and NonD::prevNondInstance.

#### 43.70.2.6 void initialize\_final\_statistics () [protected, virtual]

initializes finalStatistics for storing [NonD](#) final results Default definition of virtual function (used by sampling, reliability, and stochastic expansion methods) defines the set of statistical results to include means, standard deviations, and level mappings.

Reimplemented in [NonDInterval](#).

References NonD::cdfFlag, Model::cv(), ActiveSet::derivative\_vector(), NonD::finalStatistics, Response::function\_labels(), Model::inactive\_continuous\_variable\_ids(), Iterator::iteratedModel, NonD::numEpistemicUncVars, Iterator::numFunctions, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, and NonD::totalLevelRequests.

Referenced by NonDExpansion::NonDExpansion(), NonDIntegration::NonDIntegration(), NonDReliability::NonDReliability(), NonDSampling::NonDSampling(), and NonD::requested\_levels().

#### **43.70.2.7 void initialize\_random\_variable\_types (short *u\_space\_type*) [protected]**

initializes ranVarTypesX and ranVarTypesU within natafTransform Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the [Model](#) variables are in x-space.

References Dakota::abort\_handler(), Model::cv(), Model::distribution\_parameters(), Iterator::iteratedModel, NonD::natafTransform, NonD::numBetaVars, NonD::numContDesVars, NonD::numContStateVars, NonD::numExponentialVars, NonD::numFrechetVars, NonD::numGammaVars, NonD::numGumbelVars, NonD::numHistogramBinVars, NonD::numHistogramPtVars, NonD::numIntervalVars, NonD::numLognormalVars, NonD::numLoguniformVars, NonD::numNormalVars, NonD::numTriangularVars, NonD::numUniformVars, and NonD::numWeibullVars.

Referenced by NonDExpansion::initialize(), NonD::initialize\_random\_variables(), NonDBayesCalibration::NonDBayesCalibration(), NonDIntegration::NonDIntegration(), and NonDReliability::NonDReliability().

#### **43.70.2.8 void initialize\_random\_variable\_parameters () [protected]**

initializes ranVarMeansX, ranVarStdDevsX, ranVarLowerBndsX, ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the [Model](#) variables are in x-space.

References Dakota::abort\_handler(), Model::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Model::cv(), Model::distribution\_parameters(), Iterator::iteratedModel, NonD::natafTransform, NonD::numBetaVars, NonD::numContDesVars, NonD::numContStateVars, NonD::numExponentialVars, NonD::numFrechetVars, NonD::numGammaVars, NonD::numGumbelVars, NonD::numHistogramBinVars, NonD::numHistogramPtVars, NonD::numIntervalVars, NonD::numLognormalVars, NonD::numLoguniformVars, NonD::numNormalVars, NonD::numTriangularVars, NonD::numUniformVars, and NonD::numWeibullVars.

Referenced by NonDExpansion::initialize\_expansion(), NonD::initialize\_random\_variables(), NonDLocalReliability::quantify\_uncertainty(), NonDGlobalReliability::quantify\_uncertainty(), and NonDBayesCalibration::quantify\_uncertainty().

#### **43.70.2.9 void vars\_u\_to\_x\_mapping (const Variables & *u\_vars*, Variables & *x\_vars*) [static, protected]**

static function for RecastModels used to map u-space variables from [NonD](#) Iterators to x-space variables for [Model](#) evaluations. Map the variables from iterator space (u) to simulation space (x).

References Variables::continuous\_variables(), NonD::natafTransform, and NonD::nondInstance.

Referenced by NonD::construct\_u\_space\_model().

#### **43.70.2.10 void set\_u\_to\_x\_mapping (const Variables & *u\_vars*, const ActiveSet & *u\_set*, ActiveSet & *x\_set*) [static, protected]**

static function for RecastModels used to map u-space ActiveSets from [NonD](#) Iterators to x-space ActiveSets for [Model](#) evaluations. Define the DVV for x-space derivative evaluations by augmenting the iterator requests to account for correlations.

References Dakota::\_NPOS, Variables::all\_continuous\_variable\_ids(), Dakota::contains(), Variables::continuous\_variable\_ids(), ActiveSet::derivative\_vector(), Dakota::find\_index(), Variables::inactive\_continuous\_variable\_ids(), NonD::natafTransform, and NonD::nondInstance.

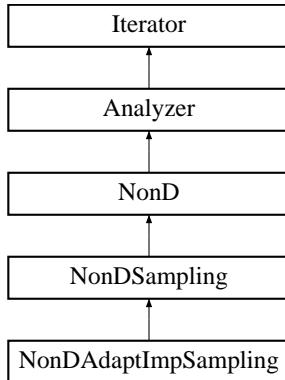

Referenced by NonD::construct\_u\_space\_model().

- DakotaNonD.H
- DakotaNonD.C

## 43.71 NonDAdaptImpSampling Class Reference

Class for the Adaptive Importance Sampling methods within DAKOTA. Inheritance diagram for NonDAdaptImpSampling::

### Public Member Functions

- [NonDAdaptImpSampling \(Model &model\)](#)

*constructors*

  - [NonDAdaptImpSampling \(Model &model, const String &sample\\_type, int samples, int seed, const String &rng, short is\\_type, bool cdf\\_flag, bool x\\_space\\_data, bool x\\_space\\_model, bool bounded\\_model\)](#)
  - [~NonDAdaptImpSampling \(\)](#)

*destructor*
- [void quantify\\_uncertainty \(\)](#)

*performs an adaptive importance sampling and returns probability of failure.*
- [void initialize \(const RealVectorArray &initial\\_points, int resp\\_fn, const Real &initial\\_prob, const Real &failure\\_threshold\)](#)

*initializes data needed for importance sampling: an initial set of points around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations*
- [void initialize \(const RealVector &initial\\_point, int resp\\_fn, const Real &initial\\_prob, const Real &failure\\_threshold\)](#)

*initializes data needed for importance sampling: an initial point around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations*
- [const Real & get\\_probability \(\)](#)

*returns the probability calculated by the importance sampling*

## Private Member Functions

- void `converge_cov ()`  
*iteratively generate samples and select representative points until coefficient of variation converges*
- void `converge_probability ()`  
*iteratively generate samples from final set of representative points until probability converges*
- void `select_init_rep_points (const RealVectorArray &samples)`  
*select representative points from initial set of samples*
- void `select_rep_points (const RealVectorArray &samples)`  
*select representative points from a set of samples*
- void `calculate_rep_weights ()`  
*calculate relative weights of representative points*
- void `generate_samples (RealVectorArray &samples)`  
*generate a set of samples based on multimodal sampling density*
- void `calculate_statistics (const RealVectorArray &samples, const size_t &total_sample_number, Real &probability_sum, Real &probability, bool cov_flag, Real &variance_sum, Real &coeff_of_variation)`  
*calculate the probability of exceeding the failure threshold and the coefficient of variation (if requested)*

## Private Attributes

- short `importanceSamplingType`  
*integration type (is, ais, mmais) provided by input specification*
- bool `invertProb`  
*flag for inversion of probability values using 1.-p*
- size\_t `numRepPoints`  
*the number of representative points around which to sample*
- size\_t `respFn`  
*the response function in the model to be sampled*
- RealVectorArray `initPoints`  
*the original set of samples passed into the MMAIS routine*
- RealVectorArray `repPoints`  
*the set of representative points around which to sample*
- RealVector `repWeights`

*the weight associated with each representative point*

- RealVector [designPoint](#)

*design point at which uncertain space is being sampled*

- bool [transInitPoints](#)

*flag to control if  $x \rightarrow u$  transformation should be performed for initial points*

- bool [transPoints](#)

*flag to control if  $u \rightarrow x$  transformation should be performed before evaluation*

- bool [useModelBounds](#)

*flag to control if the sampler should respect the model bounds*

- bool [initLHS](#)

*flag to identify if initial points are generated from an LHS sample*

- Real [initProb](#)

*the initial probability (from FORM or SORM)*

- Real [finalProb](#)

*the final calculated probability ( $p$ )*

- Real [failThresh](#)

*the failure threshold ( $z_{\bar{a}}$ ) for the problem.*

### 43.71.1 Detailed Description

Class for the Adaptive Importance Sampling methods within DAKOTA. The [NonDAdaptImpSampling](#) implements the multi-modal adaptive importance sampling used for reliability calculations. (eventually we will want to broaden this). Need to add more detail to this description.

### 43.71.2 Constructor & Destructor Documentation

#### 43.71.2.1 NonDAdaptImpSampling (Model & *model*)

constructors standard constructor

This is the primary constructor. It accepts a [Model](#) reference.

References NonD::initialize\_random\_variables(), and NonDSampling::samplingVarsMode.

**43.71.2.2 NonDAdaptImpSampling (*Model & model, const String & sample\_type, int samples, int seed, const String & rng, short is\_type, bool cdf\_flag, bool x\_space\_data, bool x\_space\_model, bool bounded\_model*)**

This is an alternate constructor for instantiations on the fly using a [Model](#) but no [ProblemDescDB](#).

References NonD::cdfFlag, and NonDSampling::samplingVarsMode.

### 43.71.3 Member Function Documentation

**43.71.3.1 void initialize (const RealVectorArray & *initial\_points*, int *resp\_fn*, const Real & *initial\_prob*, const Real & *failure\_threshold*)**

initializes data needed for importance sampling: an initial set of points around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations Initializes data using a set of starting points.

References NonDAdaptImpSampling::designPoint, NonDAdaptImpSampling::failThresh, NonDAdaptImpSampling::initPoints, NonDAdaptImpSampling::initProb, NonD::natafTransform, NonD::numContDesVars, Iterator::numContinuousVars, NonD::numUncertainVars, NonDAdaptImpSampling::respFn, and NonDAdaptImpSampling::transInitPoints.

Referenced by NonDExpansion::compute\_statistics(), NonDGlobalReliability::importance\_sampling(), NonDLocalReliability::probability(), and NonDAdaptImpSampling::quantify\_uncertainty().

**43.71.3.2 void initialize (const RealVector & *initial\_point*, int *resp\_fn*, const Real & *initial\_prob*, const Real & *failure\_threshold*)**

initializes data needed for importance sampling: an initial point around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations Initializes data using only one starting point.

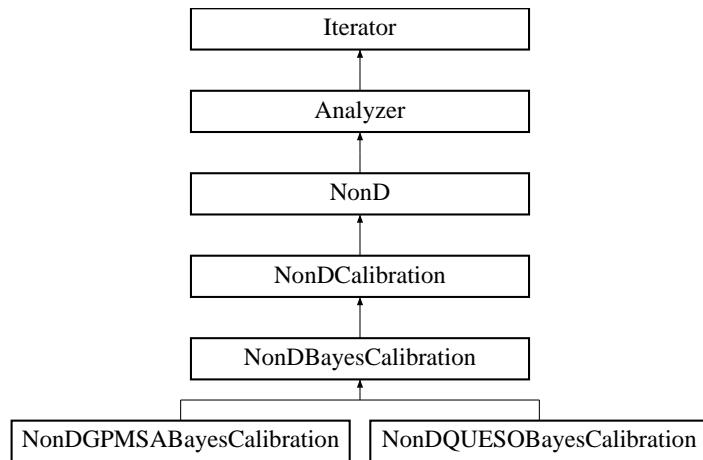

References NonDAdaptImpSampling::designPoint, NonDAdaptImpSampling::failThresh, NonDAdaptImpSampling::initPoints, NonDAdaptImpSampling::initProb, NonD::natafTransform, NonD::numContDesVars, Iterator::numContinuousVars, NonD::numUncertainVars, NonDAdaptImpSampling::respFn, and NonDAdaptImpSampling::transInitPoints.

The documentation for this class was generated from the following files:

- NonDAdaptImpSampling.H
- NonDAdaptImpSampling.C

## 43.72 NonDBayesCalibration Class Reference

Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data.  
Inheritance diagram for NonDBayesCalibration::

### Public Member Functions

- [NonDBayesCalibration \(Model &model\)](#)  
*standard constructor*
- [~NonDBayesCalibration \(\)](#)  
*destructor*

### Protected Member Functions

- void [quantify\\_uncertainty \(\)](#)  
*performs a forward uncertainty propagation of parameter distributions into response statistics*
- const [Model & algorithm\\_space\\_model \(\) const](#)  
*return the result of any recasting or surrogate model recursion layered on top of iteratedModel by the derived Iterator ctor chain*

### Protected Attributes

- [Model emulatorModel](#)  
*Model instance employed in the likelihood function; provides response function values from Gaussian processes, stochastic expansions (PCE/SC), or direct access to simulations (no surrogate option).*

- bool [standardizedSpace](#)

*flag indicating use of a variable transformation to standardized probability space*

- Iterator [stochExpIterator](#)

*NonDPolynomialChaos or NonDStochCollocation instance for defining a PCE/SC-based emulatorModel.*

## Private Attributes

- short [emulatorType](#)

*the emulator type: NO\_EMULATOR, GAUSSIAN\_PROCESS, POLYNOMIAL\_CHAOS, or STOCHASTIC\_COLLOCATION*

### 43.72.1 Detailed Description

Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data. This class will eventually provide a general-purpose framework for Bayesian inference. In the short term, it only collects shared code between QUESO and GPMSA implementations.

### 43.72.2 Constructor & Destructor Documentation

#### 43.72.2.1 NonDBayesCalibration (Model & model)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, set\_db\_list\_nodes has been called and probDescDB can be queried for settings from the method specification.

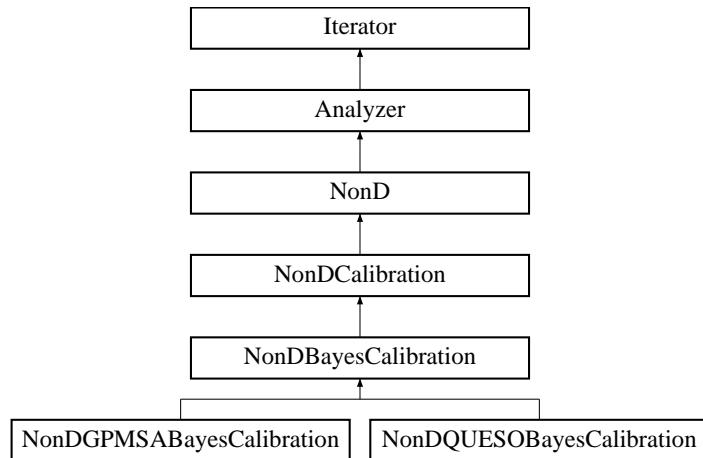

References Iterator::algorithm\_space\_model(), Model::assign\_rep(), Iterator::assign\_rep(), NonD::cdfFlag, NonD::construct\_lhs(), NonD::construct\_u\_space\_model(), NonDBayesCalibration::emulatorModel, NonDBayesCalibration::emulatorType, ProblemDescDB::get\_bool(), ProblemDescDB::get\_dusa(), ProblemDescDB::get\_int(), ProblemDescDB::get\_string(), Iterator::gradientType, Iterator::hessianType, Model::init\_communicators(), NonD::initialize\_random\_variable\_correlations(), NonD::initialize\_random\_variable\_transformation(), NonD::initialize\_random\_variable\_types(), Iterator::iteratedModel, Iterator::iterator\_rep(), Iterator::probDescDB, NonD::requested\_levels(), NonD::respLevelTarget, NonDBayesCalibration::standardizedSpace, NonDBayesCalibration::stochExpIterator, and NonD::verify\_correlation\_support().

The documentation for this class was generated from the following files:

- NonDBayesCalibration.H
- NonDBayesCalibration.C

## 43.73 NonDCalibration Class Reference

Inheritance diagram for NonDCalibration::

### Public Member Functions

- [NonDCalibration \(Model &model\)](#)  
*standard constructor*
- [~NonDCalibration \(\)](#)  
*destructor*

### Protected Member Functions

- void [set\\_configuration\\_vars \(Model &model, const RealVector &x\)](#)  
*set the passed configuration variables into the model's state vars*

### Protected Attributes

- RealVector [expStdDeviations](#)  
*1 or numFunctions standard deviations*
- String [expDataFileName](#)  
*filename from which to read experimental data; optionally configuration vars x and standard deviations sigma*
- bool [expDataFileAnnotated](#)  
*whether the data file is in annotated format*

- `size_t numExperiments`  
*number of experiments to read from data file*
- `size_t numExpConfigVars`  
*number of columns in data file which are state variables*
- `size_t numExpStdDeviationsRead`  
*how many sigmas to read from the data file (1 or numFunctions)*

## Private Member Functions

- `bool find_state_index (unsigned short state_type, UShortMultiArrayConstView variable_types, std::string context_message, size_t &start_index)`  
*helper function to lookup a state\_type enum variable type in the array of variables\_types to find its start\_index into the all array*

## Private Attributes

- `size_t continuousConfigVars`  
*number of continuous configuration variables*
- `size_t discreteIntConfigVars`  
*number of discrete integer configuration variables*
- `size_t discreteRealConfigVars`  
*number of discrete real configuration variables*
- `size_t continuousConfigStart`  
*index of configuration variables in all continuous array*
- `size_t discreteIntConfigStart`  
*index of configuration variables in all discrete integer array*
- `size_t discreteRealConfigStart`  
*index of configuration variables in all discrete real array*

### 43.73.1 Detailed Description

### 43.74.1 Detailed Description

Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals. This class is used by [NonDPolynomialChaos](#), but could also be used for general numerical integration of moments. It employs Stroud cubature rules and extensions by D. Xiu.

### 43.74.2 Constructor & Destructor Documentation

#### 43.74.2.1 NonDCubature (Model & *model*, const Pecos::ShortArray & *u\_types*, unsigned short *cub\_int\_order*)

This alternate constructor is used for on-the-fly generation and evaluation of numerical cubature points.

References [NonDCubature::check\\_integration\(\)](#), [NonDCubature::cubDriver](#), [NonDCubature::cubIntOrderRef](#), [Model::distribution\\_parameters\(\)](#), [Iterator::iteratedModel](#), and [NonDIntegration::numIntDriver](#).

**43.74.2.2 NonDCubature (Model & *model*) [protected]**

constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, set\_db\_list\_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not yet a separate nond\_cubature method specification.

References NonDCubature::check\_integration(), NonDIntegration::check\_variables(), NonDCubature::cubDriver, NonDCubature::cubIntOrderRef, NonDCubature::cubIntRule, Model::distribution\_parameters(), Iterator::iteratedModel, Iterator::maxConcurrency, NonD::natafTransform, and NonDIntegration::numIntDriver.

**43.74.3 Member Function Documentation****43.74.3.1 void sampling\_reset (int *min\_samples*, bool *all\_data\_flag*, bool *stats\_flag*) [protected, virtual]**

used by [DataFitSurrModel::build\\_global\(\)](#) to publish the minimum number of points needed from the cubature routine in order to build a particular global approximation.

Reimplemented from [Iterator](#).

References NonDCubature::cubDriver, and NonDCubature::cubIntOrderRef.

**43.74.3.2 void increment\_grid\_preference (const RealVector & *dim\_pref*) [inline, protected, virtual]**

Should not be used, but pure virtual must be defined.

Reimplemented from [NonDIntegration](#).

References NonDCubature::increment\_grid().

**43.74.3.3 int num\_samples () const [inline, protected, virtual]**

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References NonDCubature::cubDriver.

**43.74.3.4 void increment\_reference () [inline, private]**

increment each cubIntOrderRef entry by 1 cubIntOrderRef is a reference point for CubatureDriver::cubIntOrder, e.g., a lower bound

References NonDCubature::cubIntOrderRef.

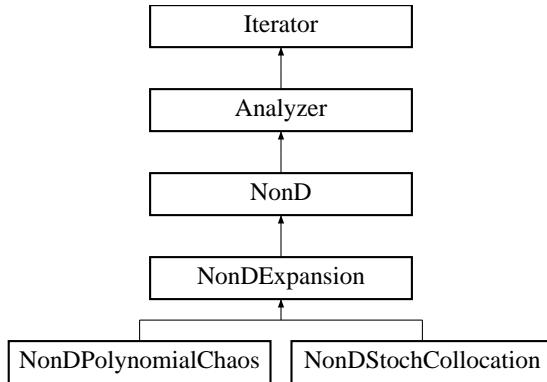

Referenced by NonDCubature::increment\_grid().

- void `print_local_sensitivity` (std::ostream &s)  
*print local sensitivities evaluated at initialPtU*
- void `compute_print_increment_results` ()  
*manage print of results following a refinement increment*
- void `compute_print_iteration_results` (bool initialize)  
*manage print of results following a refinement increment*

- void `compute_print_converged_results` (bool print\_override=false)

*manage print of results following convergence of iterative refinement*

## Private Attributes

- short `ruleNestingOverride`

*user override of default rule nesting: NO\_NESTING\_OVERRIDE, NESTED, or NON\_NESTED*

- short `ruleGrowthOverride`

*user override of default rule growth: NO\_GROWTH\_OVERRIDE, RESTRICTED, or UNRESTRICTED*

- Iterator `expansionSampler`

*Iterator used for sampling on the uSpaceModel to generate approximate probability/reliability/response level statistics. Currently this is an LHS sampling instance, but AIS could also be used.*

- Iterator `importanceSampler`

*Iterator used to refine the approximate probability estimates generated by the expansionSampler using importance sampling.*

- bool `expSampling`

*flag to indicate calculation of numerical statistics by sampling on the expansion*

- bool `impSampling`

*flag to use LHS sampling or MMAIS sampling on the expansion*

- RealVector `initialPtU`

*stores the initial variables data in u-space*

- RealMatrix `expGradsMeanX`

*derivative of the expansion with respect to the x-space variables evaluated at the means (used as uncertainty importance metrics)*

- RealSymMatrix `respCovariance`

*symmetric matrix of analytic response covariance*

- short `vbdControl`

*enumeration for controlling VBD calculation and output: NO\_VBD, UNIVARIATE\_VBD, or ALL\_VBD*

- Real `vbdDropTol`

*tolerance for omitting output of small VBD indices*

### 43.75.1 Detailed Description

Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC). The [NonDExpansion](#) class provides a base class for methods that use polynomial expansions to approximate the effect of parameter uncertainties on response functions of interest.

### 43.75.2 Member Function Documentation

#### 43.75.2.1 void compute\_statistics () [protected]

calculate analytic and numerical statistics from the expansion Calculate analytic and numerical statistics from the expansion and log results within final\_stats for use in OUU.

*set the optimization variable bounds for each cell*
- **`void get_best_sample (bool find_max, bool eval_approx)`**  
*determine truthFnStar and approxFnStar*
- **`void post_process_cell_results (bool minimize)`**  
*post-process a cell minimization/maximization result*
- **`void post_process_response_fn_results ()`**  
*post-process the interval computed for a response function*
- **`void post_process_final_results ()`**  
*perform final post-processing*

### 43.76.1 Detailed Description

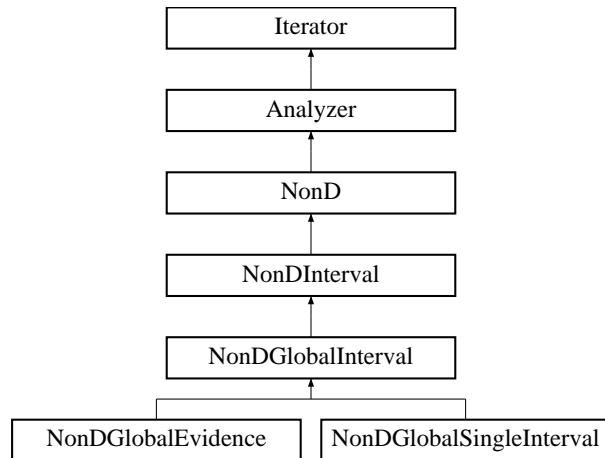

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ. The NonDEvidence class implements the propagation of epistemic uncertainty using Dempster-Shafer theory of evidence. In this approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

- NonDGlobalEvidence.H
- NonDGlobalEvidence.C

## 43.77 NonDGlobalInterval Class Reference

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification. Inheritance diagram for NonDGlobalInterval::

### Public Member Functions

- [NonDGlobalInterval \(Model &model\)](#)  
*constructor*
- [~NonDGlobalInterval \(\)](#)  
*destructor*
- void [quantify\\_uncertainty \(\)](#)

- bool `approxConverged`  
*flag indicating convergence of a GP minimization or maximization*
- bool `allResponsesPerIter`  
*flag for maximal response extraction*
- short `dataOrder`  
*order of the data used for surrogate construction, in ActiveSet request vector 3-bit format; user may override responses spec*

## Static Private Attributes

- static `NonDGlobalInterval * nondGIInstance`  
*pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data*

### 43.77.1 Detailed Description

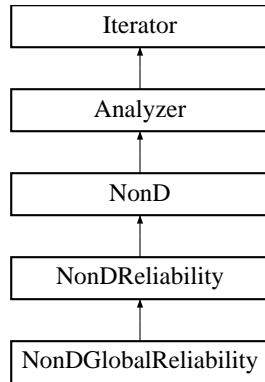

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification. The [NonDGlobalInterval](#) class supports global nongradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels. The preliminary implementation will use a Gaussian process surrogate to determine interval bounds.

The documentation for this class was generated from the following files:

- NonDGlobalInterval.H
- NonDGlobalInterval.C

## 43.78 NonDGlobalReliability Class Reference

Class for global reliability methods within DAKOTA/UQ. Inheritance diagram for NonDGlobalReliability::

### Public Member Functions

*name of the random number generator Storage for the observed x data (inputs) provided by the user*

### 43.80.1 Detailed Description

Generates posterior distribution on model parameters given experiment data. This class provides a wrapper for the functionality provided in the Los Alamos National Laboratory code called GPM/SA (Gaussian Process Models for Simulation Analysis). Although this is a code that provides input/output mapping, it DOES NOT provide the mapping that we usually think of in the NonDeterministic class hierarchy in DAKOTA, where uncertainty in parameter inputs are mapped to uncertainty in simulation responses. Instead, this class takes a pre-existing set of simulation data as well as experimental data, and maps priors on input parameters to posterior distributions on those input parameters, according to a likelihood function. The goal of the MCMC sampling is to produce posterior values of parameter estimates which will produce simulation response values that "match well" to the experimental data. The MCMC is an integral part of the calibration. The data structures in GPM/SA are fairly detailed and nested. Part of this prototyping exercise is to determine what data structures need to be specified and initialized in DAKOTA and sent to GPM/SA, and what data structures will be returned.

### 43.80.2 Constructor & Destructor Documentation

#### 43.80.2.1 NonDGPMSSABayesCalibration (Model & model)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, `set_db_list_nodes` has been called and `probDescDB` can be queried for settings from the method specification.

`NonDGPMSSABayesCalibration::lhsSampler`,    `Iterator::maximumConcurrency()`,    `NonDGPMSSABayesCalibration::numEmulatorSamples`,    `NonDGPMSSABayesCalibration::rngName`, and    `NonDGPMSSABayesCalibration::seedSpec`.

### 43.80.3 Member Function Documentation

#### 43.80.3.1 void quantify\_uncertainty () [protected, virtual]

performs a forward uncertainty propagation by using GPM/SA to generate a posterior distribution on parameters given a set of simulation parameter/response data, a set of experimental data, and additional variables to be specified here. This method does all the pre-processing necessary to call the GPM/SA code, including running

LHS on the model to generate the initial samples, doing some normalization, calling the GPM/SA functions, and returning the posterior parameter distributions.

Reimplemented from [NonDBayesCalibration](#).

### **43.81.1 Detailed Description**

Performs incremental LHS sampling for uncertainty quantification. The Latin Hypercube Sampling (LHS) package from Sandia Albuquerque's Risk and Reliability organization provides comprehensive capabilities for Monte Carlo and Latin Hypercube sampling within a broad array of user-specified probabilistic parameter distributions. The incremental LHS sampling capability allows one to supplement an initial sample of size  $n$  to size  $2n$  while maintaining the correct stratification of the  $2n$  samples and also maintaining the specified correlation structure. The incremental version of LHS will return a sample of size  $n$ , which when combined with the original sample of size  $n$ , allows one to double the size of the sample.

### 43.81.2 Constructor & Destructor Documentation

#### 43.81.2.1 NonDIncremLHSSampling (Model & *model*)

`constructor` This constructor is called for a standard letter-envelope iterator instantiation. In this case, `set_db_list_nodes` has been called and `probDescDB` can be queried for settings from the method specification.

### 43.83.1 Detailed Description

Base class for interval-based methods within DAKOTA/UQ. The `NonDInterval` class implements the propagation of epistemic uncertainty using either pure interval propagation or Dempster-Shafer theory of evidence. In the latter approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

### 43.83.2 Member Function Documentation

#### 43.83.2.1 `void print_results(std::ostream & s) [virtual]`

performs an epistemic uncertainty propagation using Dempster-Shafer evidence theory methods which solve for cumulative distribution functions of belief and plausibility print the cumulative distribution functions for belief and plausibility

Reimplemented from [Analyzer](#).

### 43.86.1 Detailed Description

Performs LHS and Monte Carlo sampling for uncertainty quantification. The Latin Hypercube Sampling (LHS) package from Sandia Albuquerque's Risk and Reliability organization provides comprehensive capabilities for Monte Carlo and Latin Hypercube sampling within a broad array of user-specified probabilistic parameter distributions. It enforces user-specified rank correlations through use of a mixing routine. The `NonDLHSSampling` class provides a C++ wrapper for the LHS library and is used for performing forward propagations of parameter uncertainties into response statistics.

### 43.86.2 Constructor & Destructor Documentation

#### 43.86.2.1 `NonDLHSSampling` (Model & model)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, `set_db_list_nodes` has been called and `probDescDB` can be queried for settings from the method specification.

References `NonDSampling::samplingVarsMode`.

#### 43.86.2.2 `NonDLHSSampling` (Model & model, const String & sample\_type, int samples, int seed, const String & rng, short sampling\_vars\_mode = ACTIVE)

alternate constructor for sample generation and evaluation "on the fly" This alternate constructor is used for generation and evaluation of Model-based sample sets. A `set_db_list_nodes` has not been performed so required data must be passed through the constructor. Its purpose is to avoid the need for a separate LHS specification within methods that use LHS sampling.

References `NonDSampling::samplingVarsMode`.

#### 43.86.2.3 NonDLHSSampling (`const String & sample_type, int samples, int seed, const String & rng, const RealVector & lower_bnds, const RealVector & upper_bnds`)

alternate constructor for sample generation "on the fly" This alternate constructor is used by [ConcurrentStrategy](#) for generation of uniform, uncorrelated sample sets. It is \_not\_ a letter-envelope instantiation and a set\_db\_list\_nodes has not been performed. It is called with all needed data passed through the constructor and is designed to allow more flexibility in variables set definition (i.e., relax connection to a variables specification and allow sampling over parameter sets such as multiobjective weights). In this case, a [Model](#) is not used and the object must only be used for sample generation (no evaluation).

References `NonDSampling::get_parameter_sets()`, and `NonDSampling::samplingVarsMode`.

### 43.86.3 Member Function Documentation

#### 43.86.3.1 void quantify\_uncertainty () [protected, virtual]

perform the evaluate parameter sets portion of run Loop over the set of samples and compute responses. Compute statistics on the set of responses if statsFlag is set.

### 43.89.1 Detailed Description

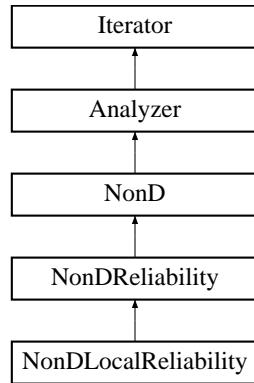

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification. The [NonDLocalInterval](#) class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels.

The documentation for this class was generated from the following files:

- NonDLocalInterval.H
- NonDLocalInterval.C

*derivative level for NPSOL executions (1 = analytic grads of objective fn, 2 = analytic grads of constraints, 3 = analytic grads of both).*
- unsigned short [warningBits](#)  
*set of warnings accumulated during execution*

### 43.90.1 Detailed Description

Class for the reliability methods within DAKOTA/UQ. The [NonDLocalReliability](#) class implements the following reliability methods through the support of different limit state approximation and integration options: mean value (MVFOSM/MVSOSM), advanced mean value method (AMV, AMV<sup>2</sup>) in x- or u-space, iterated advanced mean value method (AMV+, AMV<sup>2+</sup>) in x- or u-space, two-point adaptive nonlinearity approximation (TANA) in x- or u-space, first order reliability method (FORM), and second order reliability method (SORM). All options except mean value employ an optimizer (currently NPSOL SQP or OPT++ NIP) to solve an equality-constrained optimization problem for the most probable point (MPP). The MPP search may be formulated as the reliability index approach (RIA) for mapping response levels to reliabilities/probabilities or as the performance measure approach (PMA) for performing the inverse mapping of reliability/probability levels to response levels.

### 43.90.2 Member Function Documentation

#### 43.90.2.1 void initial\_taylor\_series () [private]

convenience function for performing the initial limit state Taylor-series approximation An initial first- or second-order Taylor-series approximation is required for MV/AMV/AMV+/TANA or for the case where meanStats or stdDevStats (from MV) are required within finalStatistics for subIterator usage of [NonDLocalReliability](#).

References Response::active\_set\_request\_vector(), Iterator::activeSet, Model::component\_parallel\_mode(), Model::compute\_response(), Model::continuous\_variables(), Dakota::copy\_data(), Model::current\_response(), NonD::finalStatistics, NonDLocalReliability::fnGradsMeanX, NonDLocalReliability::fnHessiansMeanX, NonDLocalReliability::fnValsMeanX, Response::function\_gradients(), Response::function\_hessians(), Response::function\_values(), Iterator::hessianType, Iterator::iteratedModel, NonDLocalReliability::meanStats, NonDReliability::mppSearchType, NonD::natafTransform, Iterator::numFunctions, NonD::numUncertainVars, ActiveSet::request\_vector(), NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonDLocalReliability::stdDevStats, Iterator::subIteratorFlag, NonDLocalReliability::taylorOrder, and NonDReliability::uSpaceModel.

Referenced by NonDLocalReliability::quantify\_uncertainty().

#### 43.90.2.2 void initialize\_class\_data () [private]

convenience function for initializing class scope arrays Initialize class-scope arrays and perform other start-up activities, such as evaluating median limit state responses.

References Response::active\_set\_derivative\_vector(), NonD::finalStatistics, NonDReliability::importanceSampler, NonD::initialize\_random\_variables(), NonDReliability::integrationRefinement, Iterator::iterator\_rep(), NonDReliability::mppModel, NonD::natafTransform, Iterator::numFunctions, NonDReliability::numRelAnalyses, NonD::numUncertainVars, NonDLocalReliability::prevCumASVLev0, NonDLocalReliability::prevFnGradDLev0, NonDLocalReliability::prevFnGradULev0, NonDLocalReliability::prevMPPULev0, NonDLocalReliability::ranVarMeansU, Iterator::subIteratorFlag, Model::update\_from\_subordinate\_model(), and NonDLocalReliability::warmStartFlag.

Referenced by NonDLocalReliability::mpp\_search().

#### 43.90.2.3 void initialize\_level\_data () [private]

convenience function for initializing/warm starting MPP search data for each response function prior to level 0 For a particular response function prior to the first z/p/beta level, initialize/warm-start optimizer initial guess (initialPtU), expansion point (mostProbPointX/U), and associated response data (computedRespLevel, fnGradX/U, and fnHessX/U).

References Iterator::activeSet, NonDLocalReliability::assign\_mean\_data(), Model::component\_parallel\_mode(), Model::compute\_response(), NonDReliability::computedRespLevel, Model::continuous\_variable\_ids(), Model::continuous\_variables(), Dakota::copy\_data(), Model::current\_response(), NonDLocalReliability::curvatureDataAvailable, NonDLocalReliability::fnGradU, NonDLocalReliability::fnGradX, NonDLocalReliability::fnHessU, NonDLocalReliability::fnHessX, Response::function\_gradient\_copy(), Response::function\_hessian(), Response::function\_value(), Model::inactive\_continuous\_variables(), NonDLocalReliability::initialPtU, Iterator::iteratedModel, NonDLocalReliability::mostProbPointU, NonDLocalReliability::mostProbPointX, NonDReliability::mppSearchType, NonD::natafTransform, NonDReliability::numRelAnalyses, NonD::numUncertainVars, NonDLocalReliability::prevCumASVLev0, NonDLocalReliability::prevFnGradDLev0, NonDLocalReliability::prevFnGradULev0, NonDLocalReliability::prevICVars, NonDLocalReliability::prevMPPULev0, ActiveSet::request\_value(), ActiveSet::request\_values(), NonD::requestedRespLevels, NonDReliability::respFnCount, Iterator::subIteratorFlag, Model::surrogate\_function\_indices(), NonDLocalReliability::taylorOrder, NonDLocalReliability::update\_limit\_state\_surrogate(), NonDReliability::uSpaceModel, and NonDLocalReliability::warmStartFlag.

Referenced by NonDLocalReliability::mpp\_search().

#### 43.90.2.4 void initialize\_mpp\_search\_data () [private]

convenience function for initializing/warm starting MPP search data for each z/p/beta level for each response function For a particular response function at a particular z/p/beta level, warm-start or reset the optimizer initial guess (initialPtU), expansion point (mostProbPointX/U), and associated response data (computedRespLevel, fnGradX/U, and fnHessX/U).

References NonDLocalReliability::assign\_mean\_data(), NonD::cdfFlag, NonD::computedRelLevels, NonDLocalReliability::fnGradU, NonDLocalReliability::initialPtU, NonDReliability::levelCount, NonDLocalReliability::mostProbPointU, NonDReliability::mppSearchType, NonD::numUncertainVars, NonDReliability::requestedCDFReLLevel, NonDReliability::requestedRespLevel, NonD::requestedRespLevels, NonDReliability::respFnCount, and NonDLocalReliability::warmStartFlag.

Referenced by NonDLocalReliability::mpp\_search().

#### **43.90.2.5 void update\_mpp\_search\_data (const Variables & vars\_star, const Response & resp\_star) [private]**

convenience function for updating MPP search data for each z/p/beta level for each response function Includes case-specific logic for updating MPP search data for the AMV/AMV+/TANA/NO\_APPROX methods.

References Response::active\_set(), Response::active\_set\_request\_vector(), Iterator::activeSet, NonDReliability::approxConverged, NonDReliability::approxIter, NonD::cdfFlag, Model::component\_parallel\_mode(), Model::compute\_response(), NonDReliability::computedRelLevel, NonDReliability::computedRespLevel, Model::continuous\_variable\_ids(), Model::continuous\_variables(), Variables::continuous\_variables(), Iterator::convergenceTol, Variables::copy(), Dakota::copy\_data(), Model::current\_response(), Model::current\_variables(), NonDLocalReliability::curvatureDataAvailable, Dakota::data\_pairs, NonD::finalStatistics, NonDLocalReliability::fnGradU, NonDLocalReliability::fnGradX, NonDLocalReliability::fnHessU, NonDLocalReliability::fnHessX, Response::function\_gradient\_copy(), Response::function\_hessian(), Response::function\_hessians(), Response::function\_value(), Response::function\_values(), NonDLocalReliability::initialPtU, NonDLocalReliability::integrationOrder, Model::interface\_id(), Iterator::iteratedModel, NonDReliability::levelCount, Dakota::lookup\_by\_val(), Iterator::maxIterations, NonDLocalReliability::mostProbPointU, NonDLocalReliability::mostProbPointX, NonDReliability::mppSearchType, NonD::natafTransform, Iterator::numFunctions, NonD::numNormalVars, NonD::numUncertainVars, NonDLocalReliability::reliability(), ActiveSet::request\_value(), ActiveSet::request\_values(), ActiveSet::request\_vector(), NonDReliability::requestedCDFProbLevel, NonDReliability::requestedCDFRelLevel, NonD::requestedProbLevels, NonD::requestedRelLevels, NonDReliability::requestedRespLevel, NonD::requestedRespLevels, NonDReliability::respFnCount, NonDReliability::statCount, NonDLocalReliability::taylorOrder, NonDLocalReliability::update\_limit\_state\_surrogate(), NonDReliability::uSpaceModel, NonDLocalReliability::warmStartFlag, and NonDLocalReliability::warningBits.

Referenced by NonDLocalReliability::mpp\_search().

#### **43.90.2.6 void update\_level\_data () [private]**

convenience function for updating z/p/beta level data and final statistics following MPP convergence Updates computedRespLevels/computedProbLevels/computedRelLevels, finalStatistics, warm start, and graphics data.

References Dakota::abort\_handler(), Response::active\_set\_derivative\_vector(), Response::active\_set\_request\_vector(), Graphics::add\_datapoint(), NonD::cdfFlag, NonD::computedGenRelLevels, NonD::computedProbLevels, NonDReliability::computedRelLevel, NonD::computedRelLevels, NonDReliability::computedRespLevel, NonD::computedRespLevels, NonDLocalReliability::curvatureThresh, Dakota::dakota\_graphics, NonDLocalReliability::dg\_ds\_eval(), NonD::finalStatistics, NonDLocalReliability::fnGradU, NonDLocalReliability::fnGradX, Response::function\_gradient(), Response::function\_value(), NonDLocalReliability::integrationOrder, NonDLocalReliability::kappaU, NonDReliability::levelCount, NonDLocalReliability::mostProbPointU, NonDLocalReliability::mostProbPointX, Graphics::new\_dataset(), Iterator::numFunctions, NonD::numUncertainVars, NonDLocalReliability::prevCumASVLev0, NonDLocalReliability::prevFnGradDLev0, NonDLocalReliability::prevFnGradULev0, NonDLocalReliability::prevMPPULev0, NonDLocalReliability::probability(), NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonDReliability::respFnCount, NonD::respLevelTarget, NonDLocalReliability::secondOrderIntType, NonDReliability::statCount, Iterator::subIteratorFlag, NonDLocalReliability::warmStartFlag, and NonDLocalReliability::warningBits.

Referenced by NonDLocalReliability::mpp\_search().

#### **43.90.2.7 void update\_pma\_reliability\_level () [private, virtual]**

update requestedCDFRelLevel from prescribed probabilities or prescribed generalized reliabilities by inverting second-order integrations For PMA SORM with prescribed p-level or prescribed generalized beta-level, requestedCDFRelLevel must be updated. This virtual function redefinition is called from [NonDReliability::PMA\\_constraint\\_eval\(\)](#).

Reimplemented from [NonDReliability](#).

References Variables::continuous\_variables(), Dakota::copy\_data(), Model::current\_response(), Model::current\_variables(), NonDLocalReliability::curvatureDataAvailable, NonDLocalReliability::fnGradU, NonDLocalReliability::fnHessU, Response::function\_gradient\_copy(), Response::function\_hessian(), NonDLocalReliability::integrationOrder, NonDReliability::levelCount, NonDLocalReliability::mostProbPointU, NonDReliability::mppSearchType, NonDLocalReliability::reliability(), NonDReliability::requestedCDFProbLevel, NonDReliability::requestedCDFRelLevel, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonDReliability::respFnCount, and NonDReliability::uSpaceModel.

#### **43.90.2.8 void dg\_ds\_eval (const RealVector & *x\_vars*, const RealVector & *fn\_grad\_x*, RealVector & *final\_stat\_grad*) [private]**

convenience function for evaluating dg/ds Computes dg/ds where s = design variables. Supports potentially overlapping cases of design variable augmentation and insertion.

References Response::active\_set\_derivative\_vector(), Iterator::activeSet, Model::all\_continuous\_variable\_ids(), Model::component\_parallel\_mode(), Model::compute\_response(), Dakota::contains(), Model::continuous\_variable\_ids(), Model::continuous\_variables(), Dakota::copy\_data(), Model::current\_response(), ActiveSet::derivative\_vector(), NonD::finalStatistics, Response::function\_gradient\_copy(), Response::function\_gradients(), Model::inactive\_continuous\_variable\_ids(), Iterator::iteratedModel, NonDReliability::mppSearchType, NonD::natafTransform, Iterator::primaryACVarMapIndices, ActiveSet::request\_value(), ActiveSet::request\_values(), NonDReliability::respFnCount, Iterator::secondaryACVarMapTargets, and NonDReliability::uSpaceModel.

Referenced by NonDLocalReliability::mean\_value(), NonDLocalReliability::mpp\_search(), and NonDLocalReliability::update\_level\_data().

#### **43.90.2.9 Real probability (const Real & *beta*, bool *cdf\_flag*) [private]**

Convert beta to a probability using either a first-order or second-order integration. Converts beta into a probability using either first-order (FORM) or second-order (SORM) integration. The SORM calculation first calculates the principal curvatures at the MPP (using the approach in Ch. 8 of Haldar & Mahadevan), and then applies correction formulations from the literature (Breitung, Hohenbichler-Rackwitz, or Hong).

References NonDLocalReliability::curvatureDataAvailable, NonDLocalReliability::curvatureThresh, NonDAdaptImpSampling::get\_probability(), NonDReliability::importanceSampler, NonDAdaptImpSampling::initialize(), NonDLocalReliability::integrationOrder, NonDReliability::integrationRefinement, Iterator::iterator\_rep(), NonDLocalReliability::kappaU, NonDLocalReliability::mostProbPointU, NonD::numUncertainVars, NonDLocalReliability::principal\_curvatures(), NonDReliability::

ity::requestedRespLevel, NonDReliability::respFnCount, Iterator::run\_iterator(), NonDLocalReliability::secondOrderIntType, and NonDLocalReliability::warningBits.

Referenced by NonDLocalReliability::mean\_value(), and NonDLocalReliability::update\_level\_data().

#### 43.90.2.10 Real reliability (const Real & $p$ , bool $cdf\_flag$ ) [private]

Convert probability to beta using the inverse of a first-order or second-order integration. Converts a probability into a reliability using the inverse of the first-order or second-order integrations implemented in [NonDLocalReliability::probability\(\)](#).

References Iterator::convergenceTol, NonDLocalReliability::curvatureDataAvailable, NonDLocalReliability::integrationOrder, NonDLocalReliability::kappaU, NonDLocalReliability::principal\_curvatures(), NonDLocalReliability::reliability\_residual(), NonDLocalReliability::reliability\_residual\_derivative(), and NonDLocalReliability::warningBits.

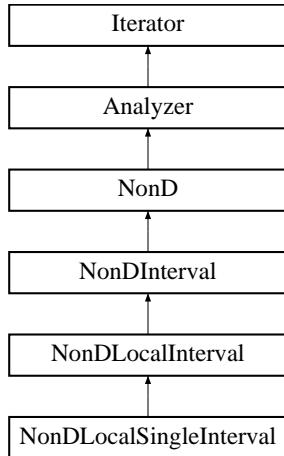

Referenced by NonDLocalReliability::mean\_value(), NonDLocalReliability::mpp\_search(), NonDLocalReliability::update\_mpp\_search\_data(), and NonDLocalReliability::update\_pma\_reliability\_level().

*counter for finalStatistics*

### 43.91.1 Detailed Description

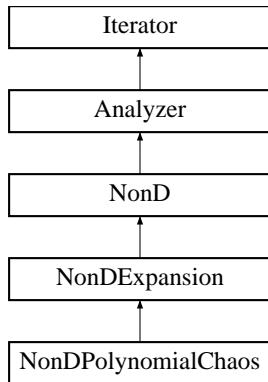

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification. The [NonDLocalSingleInterval](#) class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels.

The documentation for this class was generated from the following files:

- NonDLocalSingleInterval.H
- NonDLocalSingleInterval.C

## 43.92 NonDPolynomialChaos Class Reference

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification. Inheritance diagram for NonDPolynomialChaos::

### 43.92.1 Detailed Description

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification. The [NonDPolynomialChaos](#) class uses a polynomial chaos expansion (PCE) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the [OrthogPolyApproximation](#) class to manage multiple types of orthogonal polynomials within a Wiener-Askey scheme to PCE. It supports PCE coefficient estimation via sampling, quadrature, point-collocation, and file import.

### 43.92.2 Constructor & Destructor Documentation

#### 43.92.2.1 NonDPolynomialChaos (Model & model)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation using the [ProblemDescDB](#).

References Dakota::abort\_handler(), Model::assign\_rep(), NonDPolynomialChaos::collocRatio, NonDExpansion::construct\_cubature(), NonDExpansion::construct\_expansion\_sampler(), NonD::construct\_lhs(), NonDExpansion::construct\_quadrature(), NonDExpansion::construct\_sparse\_grid(), NonD::construct\_u\_space\_model(), Model::derivative\_concurrency(), NonDExpansion::expansionCoeffsApproach, NonDPolynomialChaos::expansionImportFile, NonDPolynomialChaos::expansionTerms, ProblemDescDB::get\_dusa(), ProblemDescDB::get\_int(), ProblemDescDB::get\_rdv(), ProblemDescDB::get\_real(), ProblemDescDB::get\_short(), ProblemDescDB::get\_string(), ProblemDescDB::get\_ushort(), Model::init\_communicators(), NonDExpansion::initialize(), NonDPolynomialChaos::initialize\_u\_space\_model(), Iterator::iteratedModel, Iterator::iterator\_rep(), Iterator::maxConcurrency, NonD::numContDesVars, NonD::numContEpistUncVars, Iterator::numContinuousVars, NonD::numContStateVars, NonDExpansion::numSamplesOnExpansion, NonDExpansion::numSamplesOnModel, Iterator::outputLevel, NonDExpansion::piecewiseBasis, Iterator::probDescDB, NonDExpansion::refineControl, NonDExpansion::refineType, NonDPolynomialChaos::resolve\_inputs(), NonDPolynomialChaos::tensorRegression, NonDPolynomialChaos::terms\_ratio\_to\_samples(), NonDPolynomialChaos::terms\_samples\_to\_ratio(), NonDPolynomialChaos::termsOrder, NonDExpansion::uSpaceModel, and Analyzer::vary\_pattern().

#### **43.92.2.2 NonDPolynomialChaos (Model & model, short exp\_coeffs\_approach, unsigned short num\_int\_level, short u\_space\_type, bool piecewise\_basis, bool use\_derivs)**

alternate constructor This constructor is used for helper iterator instantiation on the fly.

References Model::assign\_rep(), NonDExpansion::construct\_cubature(), NonDExpansion::construct\_quadrature(), NonDExpansion::construct\_sparse\_grid(), NonD::construct\_u\_space\_model(), NonDExpansion::expansionCoeffsApproach, NonDExpansion::initialize(), NonDPolynomialChaos::initialize\_u\_space\_model(), Iterator::iteratedModel, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, Iterator::outputLevel, NonDExpansion::piecewiseBasis, NonDPolynomialChaos::resolve\_inputs(), and NonDExpansion::uSpaceModel.

### **43.92.3 Member Function Documentation**

#### **43.92.3.1 void increment\_expansion () [virtual]**

uniformly increment the order of the polynomial chaos expansion Used for uniform refinement of regression-based PCE.

Reimplemented from [NonDExpansion](#).

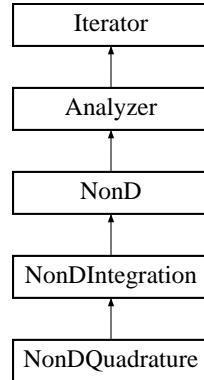

References Model::approximations(), NonDPolynomialChaos::collocRatio, NonDQuadrature::compute\_minimum\_quadrature\_order(), PecosApproximation::expansion\_terms(), NonDQuadrature::filtered\_samples(), PecosApproximation::increment\_order(), Iterator::iterator\_rep(), Model::model\_rep(), Iterator::numFunctions, NonDExpansion::numSamplesOnModel, NonDSampling::sampling\_reference(), Model::subordinate\_iterator(), NonDPolynomialChaos::tensorRegression, NonDPolynomialChaos::terms\_ratio\_to\_samples(), NonDPolynomialChaos::termsOrder, DataFitSurrModel::total\_points(), and NonDExpansion::uSpaceModel.

The documentation for this class was generated from the following files:

- NonDPolynomialChaos.H
- NonDPolynomialChaos.C

## 43.93 NonDQuadrature Class Reference

Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas. Inheritance diagram for NonDQuadrature::

### Public Member Functions

- **NonDQuadrature** ([Model](#) &model, const UShortArray &quad\_order, const RealVector &dim\_pref)  
*alternate constructor for instantiations "on the fly" based on a quadrature order specification*
- **NonDQuadrature** ([Model](#) &model, int num\_filt\_samples, const RealVector &dim\_pref)  
*alternate constructor for instantiations "on the fly" based on the size of a filtered tensor product sample set*
- const Pecos::UShortArray & [quadrature\\_order](#) () const  
*return Pecos::TensorProductDriver::quadOrder*
- void [filtered\\_samples](#) (size\_t samples)

- `void initialize_dimension_quadrature_order (unsigned short quad_order_spec, const RealVector &dim_pref_spec, UShortArray &dim_quad_order)`  
*initialize dim\_quad\_order from quad\_order\_spec and dim\_pref\_spec*

- void `nested_quadrature_order` (const UShortArray &quad\_order\_ref)  
*update Pecos::TensorProductDriver::quadOrder from dimQuadOrderRef to account for nested rule constraints*
- void `increment_dimension_quadrature_order` (UShortArray &dim\_quad\_order)  
*increment each dim\_quad\_order entry by 1*
- void `increment_dimension_quadrature_order` (const RealVector &dim\_pref, UShortArray &dim\_quad\_order)  
*increment the dim\_quad\_order entry with maximum preference by 1 and then rebalance*

## Private Attributes

- Pecos::TensorProductDriver \* `tpqDriver`  
*convenience pointer to the numIntDriver representation*
- bool `nestedRules`  
*for studies involving refinement strategies, allow for use of nested quadrature rules such as Gauss-Patterson*
- UShortArray `quadOrderSpec`  
*a sequence of scalar quadrature orders, one per refinement level*
- UShortArray `dimQuadOrderRef`  
*reference point for Pecos::TensorProductDriver::quadOrder: the original user specification for the number of Gauss points per dimension, plus any refinements posted by `increment_grid()`*
- size\_t `numFilteredSamples`  
*size of a filtered set of tensor quadrature points; used by the regression PCE approach known as "probabilistic collocation"*

### 43.93.1 Detailed Description

Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas. This class is used by `NonDPolynomialChaos`, but could also be used for general numerical integration of moments. It employs Gauss-Hermite, Gauss-Legendre, Gauss-Laguerre, Gauss-Jacobi and generalized Gauss-Laguerre quadrature for use with normal, uniform, exponential, beta, and gamma density functions and integration bounds. The abscissas and weights for one-dimensional integration are extracted from the appropriate OrthogonalPolynomial class and are extended to n-dimensions using a tensor product approach.

### 43.93.2 Constructor & Destructor Documentation

#### 43.93.2.1 NonDQuadrature (*Model & model, const UShortArray & quad\_order, const RealVector & dim\_pref*)

alternate constructor for instantiations "on the fly" based on a quadrature order specification This alternate constructor is used for on-the-fly generation and evaluation of numerical quadrature points.

References NonDIntegration::numIntDriver, and NonDQuadrature::tpqDriver.

#### 43.93.2.2 NonDQuadrature (*Model & model, int num\_filt\_samples, const RealVector & dim\_pref*)

alternate constructor for instantiations "on the fly" based on the size of a filtered tensor product sample set This alternate constructor is used for on-the-fly generation and evaluation of numerical quadrature points.

References NonDIntegration::numIntDriver, and NonDQuadrature::tpqDriver.

#### 43.93.2.3 NonDQuadrature (*Model & model*) [protected]

constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, *set\_db\_list\_nodes* has been called and *probDescDB* can be queried for settings from the method specification. It is not currently used, as there is not yet a separate *nond\_quadrature* method specification.

References NonDIntegration::check\_variables(), ProblemDescDB::get\_bool(), ProblemDescDB::get\_short(), Iterator::maxConcurrency, NonD::natafTransform, NonDQuadrature::nestedRules, NonDIntegration::numIntDriver, Iterator::probDescDB, NonDQuadrature::reset(), and NonDQuadrature::tpqDriver.

### 43.93.3 Member Function Documentation

#### 43.93.3.1 void initialize\_grid (*const std::vector< Pecos::BasisPolynomial > & poly\_basis*) [protected, virtual]

Used in combination with alternate [NonDQuadrature](#) constructor.

Implements [NonDIntegration](#).

References NonDQuadrature::compute\_minimum\_quadrature\_order(), Iterator::maxConcurrency, NonDQuadrature::nestedRules, Iterator::numContinuousVars, NonDQuadrature::numFilteredSamples, NonDQuadrature::reset(), and NonDQuadrature::tpqDriver.

#### 43.93.3.2 void sampling\_reset (*int min\_samples, bool all\_data\_flag, bool stats\_flag*) [protected, virtual]

used by [DataFitSurrModel::build\\_global\(\)](#) to publish the minimum number of points needed from the quadrature routine in order to build a particular global approximation.

Reimplemented from [Iterator](#).

References NonDQuadrature::compute\_minimum\_quadrature\_order(), NonDIntegration::dimPrefSpec,

NonDQuadrature::dimQuadOrderRef, NonDQuadrature::nested\_quadrature\_order(), NonDQuadrature::nestedRules, Iterator::numContinuousVars, and NonDQuadrature::tpqDriver.

#### 43.93.3.3 int num\_samples () const [inline, protected, virtual]

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References NonDQuadrature::numFilteredSamples, and NonDQuadrature::tpqDriver.

#### 43.93.3.4 void anisotropic\_preference (unsigned short quad\_order\_spec, const RealVector & dim\_pref\_spec, UShortArray & dim\_quad\_order) [private]

initialize quad\_order vector based on quad\_order\_spec scalar and dim\_pref\_spec vector This version of [anisotropic\\_preference\(\)](#) converts a scalar quad\_order\_spec and a dim\_pref vector into a quad\_order vector. It is used for initialization and does not enforce a reference lower bound.

References Iterator::numContinuousVars.

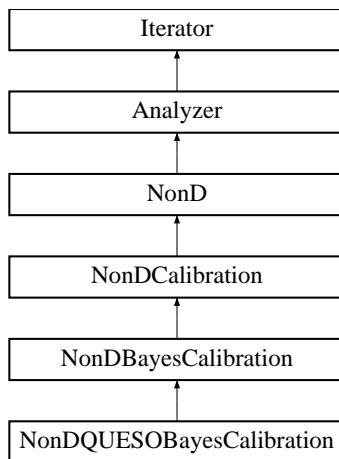

Referenced by NonDQuadrature::increment\_dimension\_quadrature\_order(), and NonDQuadrature::initialize\_dimension\_quadrature\_order().

### 43.94.1 Detailed Description

Bayesian inference using the QUESO library from UT Austin. This class provides a wrapper to the QUESO library developed as part of the Predictive Science Academic Alliance Program (PSAAP), specifically the PECOS (Predictive Engineering and Computational Sciences) Center at UT Austin. The name QUESO stands for Quantification of Uncertainty for Estimation, Simulation, and Optimization.

### 43.94.2 Constructor & Destructor Documentation

#### 43.94.2.1 NonDQUESOBayesCalibration (Model & *model*)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, set\_db\_list\_nodes has been called and probDescDB can be queried for settings from the method specification.

### 43.94.3 Member Function Documentation

## Static Protected Attributes

- static NonDReliability \* **nondReInstance**  
*pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data*

### 43.95.1 Detailed Description

Base class for the reliability methods within DAKOTA/UQ. The **NonDReliability** class provides a base class for **NonDLocalReliability**, which implements traditional MPP-based reliability methods, and **NonDGlobalReliability**, which implements global limit state search using Gaussian process models in combination with multimodal importance sampling.

## 43.95.2 Member Function Documentation

**43.95.2.1 void RIA\_objective\_eval (const Variables & *sub\_model\_vars*, const Variables & *recast\_vars*, const Response & *sub\_model\_response*, Response & *recast\_response*) [static, protected]**

static function used as the objective function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of  $(\text{norm } u)^2$ . This function recasts a  $G(u)$  response set (already transformed and approximated in other recursions) into an RIA objective function.

References Response::active\_set\_request\_vector(), Variables::continuous\_variables(), Response::function\_gradient\_view(), Response::function\_hessian\_view(), and Response::function\_value().

Referenced by NonDLocalReliability::mpp\_search().

**43.95.2.2 void RIA\_constraint\_eval (const Variables & *sub\_model\_vars*, const Variables & *recast\_vars*, const Response & *sub\_model\_response*, Response & *recast\_response*) [static, protected]**

static function used as the constraint function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the constraint of  $G(u) = \text{response level}$ . This function recasts a  $G(u)$  response set (already transformed and approximated in other recursions) into an RIA equality constraint.

References Response::active\_set\_request\_vector(), Response::function\_gradient(), Response::function\_gradient\_view(), Response::function\_hessian(), Response::function\_value(), NonDReliability::nondRelInstance, NonDReliability::requestedRespLevel, and NonDReliability::respFnCount.

Referenced by NonDLocalReliability::mpp\_search().

**43.95.2.3 void PMA\_objective\_eval (const Variables & *sub\_model\_vars*, const Variables & *recast\_vars*, const Response & *sub\_model\_response*, Response & *recast\_response*) [static, protected]**

static function used as the objective function in the Performance Measure Approach (PMA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of  $G(u)$ . This function recasts a  $G(u)$  response set (already transformed and approximated in other recursions) into an PMA objective function.

### 43.96.1 Detailed Description

Base class for common code between [NonDLHSSampling](#), [NonDIncremLHSSampling](#), and [NonDAdaptImpSampling](#). This base class provides common code for sampling methods which employ the Latin Hypercube Sampling (LHS) package from Sandia Albuquerque's Risk and Reliability organization. [NonDSampling](#) now exclusively utilizes the 1998 Fortran 90 LHS version as documented in SAND98-0210, which was converted to a UNIX link library in 2001. The 1970's vintage LHS (that had been f2c'd and converted to incomplete classes) has been removed.

### 43.96.2 Constructor & Destructor Documentation

#### 43.96.2.1 NonDSampling (Model & *model*) [protected]

constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, set\_db\_list\_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort\_handler(), NonD::initialize\_final\_statistics(), Iterator::maxConcurrency, NonD::numEpistemicUncVars, NonDSampling::numSamples, NonDSampling::sampleType, and NonD::totalLevelRequests.

#### 43.96.2.2 NonDSampling (NoDBBaseConstructor, Model & *model*, const String & *sample\_type*, int *samples*, int *seed*, const String & *rng*) [protected]

alternate constructor for sample generation and evaluation "on the fly" This alternate constructor is used for generation and evaluation of on-the-fly sample sets.

References Iterator::maxConcurrency, NonDSampling::numSamples, NonDSampling::sampleType, and Iterator::subIteratorFlag.

#### 43.96.2.3 NonDSampling (NoDBBaseConstructor, const String & *sample\_type*, int *samples*, int *seed*, const String & *rng*, const RealVector & *lower\_bnds*, const RealVector & *upper\_bnds*) [protected]

alternate constructor for sample generation "on the fly" This alternate constructor is used by [ConcurrentStrategy](#) for generation of uniform, uncorrelated sample sets.

References Iterator::maxConcurrency, NonDSampling::numSamples, NonDSampling::sampleType, and Iterator::subIteratorFlag.

### 43.96.3 Member Function Documentation

#### 43.96.3.1 int num\_samples () const [inline, protected, virtual]

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References NonDSampling::numSamples.

Referenced by NonDAdaptImpSampling::generate\_samples(), NonDAdaptImpSampling::select\_init\_rep\_points(), and NonDAdaptImpSampling::select\_rep\_points().

#### 43.96.3.2 void sampling\_reset (int min\_samples, bool all\_data\_flag, bool stats\_flag) [inline, protected, virtual]

resets number of samples and sampling flags used by [DataFitSurrModel::build\\_global\(\)](#) to publish the minimum number of samples needed from the sampling routine (to build a particular global approximation) and to set allDataFlag and statsFlag. In this case, allDataFlag is set to true (vectors of variable and response sets must be returned to build the global approximation) and statsFlag is set to false (statistics computations are not needed).

Reimplemented from [Iterator](#).

References NonDSampling::allDataFlag, NonDSampling::numSamples, NonDSampling::samplesRef, and NonDSampling::statsFlag.

#### 43.96.3.3 void get\_parameter\_sets (Model & model) [protected, virtual]

Uses lhsDriver to generate a set of samples from the distributions/bounds defined in the incoming model. This version of [get\\_parameter\\_sets\(\)](#) extracts data from the user-defined model in any of the four sampling modes.

Reimplemented from [Analyzer](#).

References Model::all\_continuous\_lower\_bounds(), Model::all\_continuous\_upper\_bounds(), Model::all\_discrete\_int\_lower\_bounds(), Model::all\_discrete\_int\_upper\_bounds(), Analyzer::allSamples, Model::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Model::current\_variables(), Model::discrete\_design\_set\_int\_values(), Model::discrete\_design\_set\_real\_values(), Model::discrete\_int\_lower\_bounds(), Model::discrete\_int\_upper\_bounds(), Model::discrete\_state\_set\_int\_values(), Model::discrete\_state\_set\_real\_values(), Model::distribution\_parameters(), NonDSampling::initialize\_lhs(), NonDSampling::lhsDriver, NonD::numContAleatUncVars, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, NonD::numDiscIntAleatUncVars, NonD::numDiscIntDesVars, NonD::numDiscIntEpistUncVars, NonD::numDiscIntStateVars, NonDSampling::numSamples, NonDSampling::sampleRanks, NonDSampling::samplingVarsMode, and Variables::view().

Referenced by NonDLHSSampling::NonDLHSSampling(), NonDLHSSampling::pre\_run(), NonDIcremLHSSampling::quantify\_uncertainty(), and NonDAdaptImpSampling::quantify\_uncertainty().

#### 43.96.3.4 void get\_parameter\_sets (const RealVector & *lower\_bnds*, const RealVector & *upper\_bnds*) [protected]

Uses lhsDriver to generate a set of uniform samples over lower\_bnds/upper\_bnds. This version of [get\\_parameter\\_sets\(\)](#) does not extract data from the user-defined model, but instead relies on the incoming bounded region definition. It only support a UNIFORM sampling mode, where the distinction of ACTIVE\_UNIFORM vs. ALL\_UNIFORM is handled elsewhere.

### 43.97.1 Detailed Description

Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables. This class is used by [NonDPolynomialChaos](#) and [NonDStochCollocation](#), but could also be used for general numerical integration of moments. It employs 1-D Clenshaw-Curtis and Gaussian quadrature rules within Smolyak sparse grids.

### 43.97.2 Constructor & Destructor Documentation

#### 43.97.2.1 NonDSparseGrid (*Model & model, const UShortArray & ssg\_level, const RealVector & dim\_pref, short refine\_control = Pecos::NO\_CONTROL, bool track\_uniq\_prod\_wts = true, short growth\_rate = Pecos::MODERATE\_RESTRICTED\_GROWTH*)

This alternate constructor is used for on-the-fly generation and evaluation of sparse grids within PCE and SC.

References [NonDIntegration::numIntDriver](#), and [NonDSparseGrid::ssgDriver](#).

#### 43.97.2.2 NonDSparseGrid (*Model & model*) [protected]

constructor This constructor is called for a standard letter-envelope iterator instantiation. In this case, `set_db_list_nodes` has been called and `probDescDB` can be queried for settings from the method specification. It is not currently used, as there is not a separate `sparse_grid` method specification.

References [NonDIntegration::check\\_variables\(\)](#), [NonDIntegration::dimPrefSpec](#), [Model::distribution\\_parameters\(\)](#), [ProblemDescDB::get\\_bool\(\)](#), [ProblemDescDB::get\\_short\(\)](#), [Iterator::iteratedModel](#), [Iterator::maxConcurrency](#), [NonD::natafTransform](#), [NonDIntegration::numIntDriver](#), [Iterator::probDescDB](#), [NonDSparseGrid::ssgDriver](#), and [NonDSparseGrid::ssgLevelRef](#).

### 43.97.3 Member Function Documentation

#### 43.97.3.1 int num\_samples () const [inline, virtual]

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References NonDSparseGrid::ssgDriver.

#### 43.97.3.2 void sampling\_reset (int min\_samples, bool all\_data\_flag, bool stats\_flag) [protected, virtual]

used by [DataFitSurrModel::build\\_global\(\)](#) to publish the minimum number of points needed from the sparse grid routine in order to build a particular global approximation.

Reimplemented from [Iterator](#).

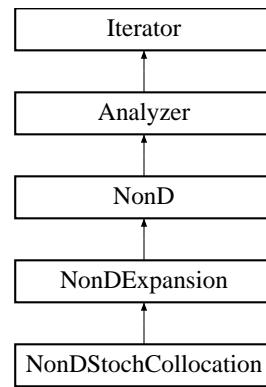

References NonDSparseGrid::ssgDriver, and NonDSparseGrid::ssgLevelRef.

The documentation for this class was generated from the following files:

- NonDSparseGrid.H
- NonDSparseGrid.C

## 43.98 NonDStochCollocation Class Reference

Nonintrusive stochastic collocation approaches to uncertainty quantification. Inheritance diagram for NonDStochCollocation::

### Public Member Functions

*standard constructor*
- [NonDStochCollocation \(Model &model, short exp\\_coeffs\\_approach, unsigned short num\\_int\\_level, short u\\_space\\_type, bool piecewise\\_basis, bool use\\_derivs\)](#)  
*alternate constructor*
- [~NonDStochCollocation \(\)](#)  
*destructor*

### Protected Member Functions

- void [resolve\\_inputs](#) (short &u\_space\_type, short &data\_order)  
*perform error checks and mode overrides*
- void [initialize\\_u\\_space\\_model \(\)](#)  
*initialize uSpaceModel polynomial approximations with PCE/SC data*

#### 43.98.1 Detailed Description

Nonintrusive stochastic collocation approaches to uncertainty quantification. The [NonDStochCollocation](#) class uses a stochastic collocation (SC) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the [InterpPolyApproximation](#) class to manage multidimensional Lagrange polynomial interpolants.

## 43.98.2 Constructor & Destructor Documentation

### 43.98.2.1 NonDStochCollocation (Model & model)

standard constructor This constructor is called for a standard letter-envelope iterator instantiation using the [ProblemDescDB](#).

References Model::assign\_rep(), NonDExpansion::construct\_expansion\_sampler(), NonDExpansion::construct\_quadrature(), NonDExpansion::construct\_sparse\_grid(), NonD::construct\_u\_space\_model(), Model::derivative\_concurrency(), NonDExpansion::expansionCoeffsApproach, ProblemDescDB::get\_dusa(), ProblemDescDB::get\_rdv(), ProblemDescDB::get\_short(), Model::init\_communicators(), NonDExpansion::initialize(), NonDStochCollocation::initialize\_u\_space\_model(), Iterator::iteratedModel, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, NonDExpansion::numSamplesOnExpansion, Iterator::outputLevel, NonDExpansion::piecewiseBasis, Iterator::probDescDB, NonDStochCollocation::resolve\_inputs(), and NonDExpansion::uSpaceModel.

### 43.98.2.2 NonDStochCollocation (Model & model, short exp\_coeffs\_approach, unsigned short num\_int\_level, short u\_space\_type, bool piecewise\_basis, bool use\_derivs)

alternate constructor This constructor is used for helper iterator instantiation on the fly.

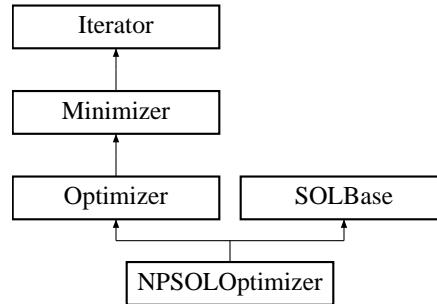

References Model::assign\_rep(), NonDExpansion::construct\_quadrature(), NonDExpansion::construct\_sparse\_grid(), NonD::construct\_u\_space\_model(), NonDExpansion::expansionCoeffsApproach, NonDExpansion::initialize(), NonDStochCollocation::initialize\_u\_space\_model(), Iterator::iteratedModel, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, Iterator::outputLevel, NonDExpansion::piecewiseBasis, NonDExpansion::refineType, NonDStochCollocation::resolve\_inputs(), and NonDExpansion::uSpaceModel.

The documentation for this class was generated from the following files:

## Static Private Member Functions

- static void [objective\\_eval](#) (int &mode, int &n, double \*x, double &f, double \*gradf, int &nstate)

*OBJFUN in NPSOL manual: computes the value and first derivatives of the objective function (passed by function pointer to NPSOL).*

## Private Attributes

- String [setUpType](#)

*controls iteration mode: "model" (normal usage) or "user\_functions" (user-supplied functions mode for "on the fly" instantiations). [NonDReliability](#) currently uses the user\_functions mode.*

- RealVector [initialPoint](#)

*holds initial point passed in for "user\_functions" mode.*

- RealVector [lowerBounds](#)

*holds variable lower bounds passed in for "user\_functions" mode.*

- RealVector [upperBounds](#)

*holds variable upper bounds passed in for "user\_functions" mode.*

- void(\* [userObjectiveEval](#) )(int &, int &, double \*, double &, double \*, int &)

*holds function pointer for objective function evaluator passed in for "user\_functions" mode.*

- void(\* [userConstraintEval](#) )(int &, int &, int &, int \*, double \*, double \*, double \*, int &)

*holds function pointer for constraint function evaluator passed in for "user\_functions" mode.*

## Static Private Attributes

- static [NPSOLOptimizer](#) \* [npsolInstance](#)

*pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data*

### 43.99.1 Detailed Description

Wrapper class for the NPSOL optimization library. The [NPSOLOptimizer](#) class provides a wrapper for NPSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: `max_function_evaluations` is implemented directly in NPSOLOptimizer's evaluator functions since there is no NPSOL parameter equivalent, and `max_iterations`, `convergence_tolerance`, `output_verbosity`, `verify_level`, `function_precision`, and `linesearch_tolerance` are mapped into NPSOL's "Major Iteration Limit", "Optimality Tolerance", "Major Print Level" (`verbose`: Major Print Level = 20; `quiet`: Major Print Level = 10), "Verify Level", "Function Precision", and "Linesearch Tolerance" parameters, respectively, using NPSOL's `npoptn()` subroutine (as wrapped by `npoptn2()` from the `npoptn_wrapper.f` file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NPSOL's optional input parameters and the `npoptn()` subroutine.

### 43.99.2 Constructor & Destructor Documentation

#### 43.99.2.1 NPSOLOptimizer (Model & *model*)

standard constructor This is the primary constructor. It accepts a [Model](#) reference.

References [Minimizer::constraintTol](#), [Iterator::convergenceTol](#), [Iterator::fdGradStepSize](#), [ProblemDescDB::get\\_int\(\)](#), [ProblemDescDB::get\\_real\(\)](#), [Iterator::gradientType](#), [Iterator::maxIterations](#), [Iterator::outputLevel](#), [Iterator::probDescDB](#), [SOLBase::set\\_options\(\)](#), [Minimizer::speculativeFlag](#), and [Minimizer::vendorNumericalGradFlag](#).

#### 43.99.2.2 NPSOLOptimizer (NoDBBaseConstructor, Model & *model*)

alternate constructor for [Iterator](#) instantiations by name This is an alternate constructor which accepts a [Model](#) but does not have a supporting method specification from the [ProblemDescDB](#).

References [Minimizer::constraintTol](#), [Iterator::convergenceTol](#), [Iterator::fdGradStepSize](#), [Iterator::gradientType](#), [Iterator::maxIterations](#), [Iterator::outputLevel](#), [SOLBase::set\\_options\(\)](#), [Minimizer::speculativeFlag](#), and [Minimizer::vendorNumericalGradFlag](#).

#### 43.99.2.3 NPSOLOptimizer (Model & *model*, const int & *derivative\_level*, const Real & *conv\_tol*)

alternate constructor for instantiations "on the fly" This is an alternate constructor for instantiations on the fly using a [Model](#) but no [ProblemDescDB](#).

**43.99.2.4 NPSOLOptimizer (const RealVector & *initial\_point*, const RealVector & *var\_lower\_bnds*, const RealVector & *var\_upper\_bnds*, const RealMatrix & *lin\_ineq\_coeffs*, const RealVector & *lin\_ineq\_lower\_bnds*, const RealVector & *lin\_ineq\_upper\_bnds*, const RealMatrix & *lin\_eq\_coeffs*, const RealVector & *lin\_eq\_targets*, const RealVector & *nonlin\_ineq\_lower\_bnds*, const RealVector & *nonlin\_ineq\_upper\_bnds*, const RealVector & *nonlin\_eq\_targets*, void(\*)(int &, int &, double \*, double &, double \*, int &) *user\_obj\_eval*, void(\*)(int &, int &, int &, int \*, double \*, double \*, int &) *user\_con\_eval*, const int & *derivative\_level*, const Real & *conv\_tol*)**

alternate constructor for instantiations "on the fly" This is an alternate constructor for performing an optimization using the passed in objective function and constraint function pointers.

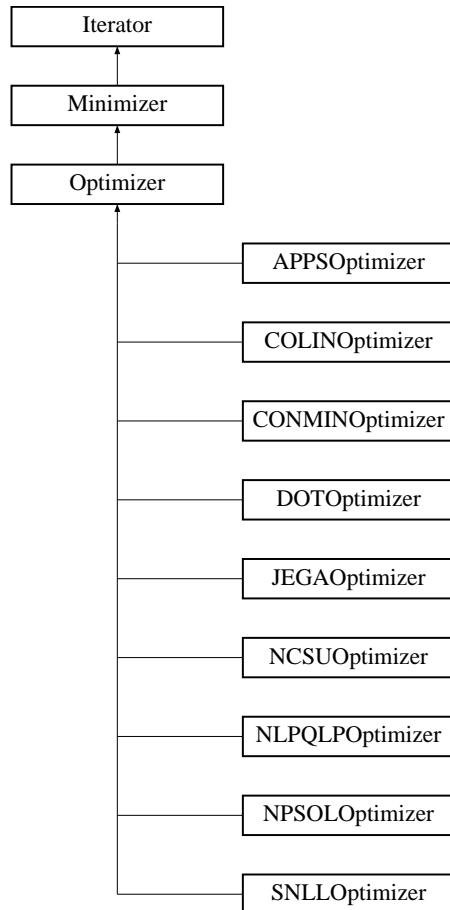

References SOLBase::allocate\_arrays(), SOLBase::allocate\_workspace(), SOLBase::augment\_bounds(), NPSOLOptimizer::lowerBounds, Iterator::numContinuousVars, Minimizer::numLinearConstraints, Minimizer::numNonlinearConstraints, and NPSOLOptimizer::upperBounds.

The documentation for this class was generated from the following files:

### 43.100.1 Detailed Description

Base class for the optimizer branch of the iterator hierarchy. The `Optimizer` class provides common data and functionality for `DOTOptimizer`, `CONMINOptimizer`, `NPSOLOptimizer`, `SNLLOptimizer`, `NLPQLPOptimizer`, `COLINOptimizer`, and `JEGAOptimizer`.

### 43.100.2 Constructor & Destructor Documentation

#### 43.100.2.1 Optimizer (Model & model) [protected]

standard constructor This constructor extracts the inherited data for the optimizer branch and performs sanity checking on gradient and constraint settings.

References `Dakota::abort_handler()`, `Iterator::activeSet`, `Model::assign_rep()`, `String::begins()`, `Iterator::bestVariablesArray`, `Minimizer::boundConstraintFlag`, `Variables::copy()`, `Model::current_response()`, `Model::current_variables()`, `Minimizer::cvScaleTypes`, `ProblemDescDB::get_sizet()`, `Minimizer::gnewton_set_recast()`, `Iterator::gradientType`, `Iterator::hessianType`, `Model::init_communicators()`, `RecastModel::initialize()`, `Minimizer::initialize_scaling()`, `Iterator::iteratedModel`, `Optimizer::localObjectiveRecast`, `Iterator::maxConcurrency`, `Iterator::methodName`, `Model::model_rep()`, `Model::model_type()`, `Iterator::numContinuousVars`, `Iterator::numFunctions`, `Minimizer::numIterPrimaryFns`, `Minimizer::numNonlinearConstraints`, `Minimizer::numNonlinearIneqConstraints`, `Optimizer::numObjectiveFns`, `Minimizer::numUserPrimaryFns`, `Minimizer::optimizationFlag`, `Optimizer::primary_resp_recast()`, `Minimizer::primaryRespScaleFlag`, `Iterator::probDescDB`, `ActiveSet::request_vector()`, `Response::reshape()`, `Minimizer::responseScaleTypes`, `Minimizer::scaleFlag`, `Minimizer::secondary_resp_recast()`, `Minimizer::secondaryRespScaleFlag`, `Minimizer::speculativeFlag`, `Minimizer::variables_recast()`, and `Minimizer::varsScaleFlag`.

### 43.100.3 Member Function Documentation

#### 43.100.3.1 void initialize\_run () [protected, virtual]

Implements portions of initialize\_run specific to Optimizers. This function should be invoked (or reimplemented) by any derived implementations of [initialize\\_run\(\)](#) (which would otherwise hide it).

Reimplemented from [Minimizer](#).

Reimplemented in [CONMINOptimizer](#), [DOTOptimizer](#), [NLPQLPOptimizer](#), and [SNLLOptimizer](#).

References `Iterator::iteratedModel`, `Optimizer::localObjectiveRecast`, `Optimizer::optimizerInstance`, `Optimizer::prevOptInstance`, `Minimizer::scaleFlag`, and `Model::update_from_subordinate_model()`.

#### 43.100.3.2 void run () [inline, protected, virtual]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References `Optimizer::find_optimum()`.

#### 43.100.3.3 void post\_run (std::ostream & s) [protected, virtual]

Implements portions of post\_run specific to Optimizers. This function should be invoked (or reimplemented) by any derived implementations of [post\\_run\(\)](#) (which would otherwise hide it).

Reimplemented from [Iterator](#).

Reimplemented in [COLINOptimizer](#), and [SNLLOptimizer](#).

References `Dakota::abort_handler()`, `Response::active_set_request_vector()`, `Iterator::bestResponseArray`, `Iterator::bestVariablesArray`, `Variables::continuous_variables()`, `Response::copy()`, `Minimizer::cvScaleMultipliers`, `Minimizer::cvScaleOffsets`, `Minimizer::cvScaleTypes`, `Optimizer::local_objective_recast_retrieve()`, `Optimizer::localObjectiveRecast`, `Minimizer::modify_s2n()`, `Minimizer::need_resp_trans_byvars()`, `Minimizer::numNonlinearConstraints`, `Minimizer::numUserPrimaryFns`, `Minimizer::primaryRespScaleFlag`, `Minimizer::response_modify_s2n()`, `Minimizer::secondaryRespScaleFlag`, `Response::update_partial()`, and `Minimizer::varsScaleFlag`.

#### 43.100.3.4 void finalize\_run () [inline, protected, virtual]

utility function to perform common operations following [post\\_run\(\)](#); deallocation and resetting of instance pointers Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [finalize\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented from [Minimizer](#).

Reimplemented in [SNLLOptimizer](#).

References `Optimizer::optimizerInstance`, and `Optimizer::prevOptInstance`.

**43.100.3.5 void print\_results (std::ostream & s) [protected, virtual]**

Redefines default iterator results printing to include optimization results (objective functions and constraints).

Reimplemented from [Iterator](#).

References `Dakota::abort_handler()`, `Iterator::bestResponseArray`, `Iterator::bestVariablesArray`, `Dakota::data_pairs`, `Model::interface_id()`, `Iterator::iteratedModel`, `Dakota::lookup_by_val()`, `Iterator::numContinuousVars`, `Iterator::numFunctions`, `Minimizer::numUserPrimaryFns`, and `Dakota::write_data_partial()`.

**43.100.3.6 void primary\_resp\_recast (const Variables & native\_vars, const Variables & scaled\_vars, const Response & native\_response, Response & iterator\_response) [static, private]**

primary response conversion map for [RecastModel](#) used in scaling and multiobjective: transform objectives (fns, grads, Hessians) from native (user) to iterator space Objective function map from user/native space to iterator/scaled/combined space using a [RecastModel](#). If resizing the response, copies the constraint (secondary) data from native\_response too

References `Response::active_set_request_vector()`, `Response::copy()`, `Iterator::iteratedModel`, `Optimizer::localObjectiveRecast`, `Minimizer::need_resp_trans_byvars()`, `Minimizer::numUserPrimaryFns`, `Optimizer::objective_reduction()`, `Optimizer::optimizerInstance`, `Iterator::outputLevel`, `Model::primary_response_fn_weights()`, `Minimizer::primaryRespScaleFlag`, `Minimizer::response_modify_n2s()`, `Model::subordinate_model()`, and `Response::update_partial()`.

Referenced by `Optimizer::Optimizer()`.

**43.100.3.7 void objective\_reduction (const Response & full\_response, const RealVector & full\_wts, Response & reduced\_response) const [private]**

forward mapping: maps multiple primary response functions to a single weighted objective for single-objective optimizers This function is responsible for the mapping of multiple objective functions into a single objective for publishing to single-objective optimizers. Used in [DOTOptimizer](#), [NPSOLOptimizer](#), [SNLLOptimizer](#), and [SGOPTApplication](#) on every function evaluation. The simple weighting approach (using primaryRespFnWts) is the only technique supported currently. The weightings are used to scale function values, gradients, and Hessians as needed.

References `Dakota::abort_handler()`, `Response::active_set_request_vector()`, `Response::function_gradient_view()`, `Response::function_gradients()`, `Response::function_hessian_view()`, `Response::function_hessians()`, `Response::function_value()`, `Response::function_values()`, `Minimizer::numUserPrimaryFns`, `Minimizer::objective()`, `Minimizer::objective_gradient()`, `Minimizer::objective_hessian()`, `Iterator::outputLevel`, `Dakota::write_col_vector_trans()`, `Dakota::write_data()`, and `Dakota::write_precision`.

Referenced by `Optimizer::primary_resp_recast()`.

**43.100.3.8 void local\_objective\_recast\_retrieve (const Variables & vars, Response & response) const [private]**

infers MOO/NLS solution from the solution of a single-objective optimizer Retrieve a MOO/NLS response based on the data returned by a single objective optimizer by performing a data\_pairs search.

References Response::active\_set(), Dakota::data\_pairs, Model::interface\_id(), Iterator::iteratedModel, Dakota::lookup\_by\_val(), Minimizer::numUserPrimaryFns, and Response::update().

Referenced by Optimizer::post\_run().

*the [ParallelLibrary](#) class has special access privileges in order to streamline implementation*

### 43.101.1 Detailed Description

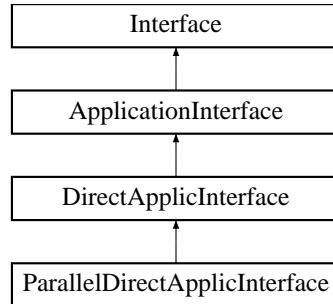

Container class for a set of [ParallelLevel](#) list iterators that collectively identify a particular multilevel parallel configuration. Rather than containing the multilevel parallel configuration directly, [ParallelConfiguration](#) instead provides a set of list iterators which point into a combined list of [ParallelLevels](#). This approach allows different configurations to reuse [ParallelLevels](#) without copying them. A list of [ParallelConfigurations](#) is contained in [ParallelLibrary](#) ([ParallelLibrary::parallelConfigurations](#)).

The documentation for this class was generated from the following file:

- [ParallelLibrary.H](#)

## 43.102 ParallelDirectApplicInterface Class Reference

Sample derived interface class for testing parallel simulator plug-ins using [assign\\_rep\(\)](#). Inheritance diagram for ParallelDirectApplicInterface:::

### Public Member Functions

- [~ParallelDirectApplicInterface](#) ()  
*destructor*

### Protected Member Functions

- int [derived\\_map\\_ac](#) (const Dakota::String &ac\_name)  
*execute an analysis code portion of a direct evaluation invocation*

#### 43.102.1 Detailed Description

Sample derived interface class for testing parallel simulator plug-ins using [assign\\_rep\(\)](#). The plug-in [ParallelDirectApplicInterface](#) resides in namespace [SIM](#) and uses a copy of [textbook\(\)](#) to perform parallel parameter to response mappings. It may be activated by specifying the `--with-plugin` configure option, which activates the `DAKOTA_PLUGIN` macro in `dakota_config.h` used by [main.C](#) (which activates the plug-in code block within that file) and activates the `PLUGIN_S` declaration defined in `Makefile.include` and used in `Makefile.source` (which add this class to the build). Test input files should then use an `analysis_driver` of "plugin\_textbook".

The documentation for this class was generated from the following files:

- [PluginParallelDirectApplicInterface.H](#)
- [PluginParallelDirectApplicInterface.C](#)

## 43.103 ParallelLevel Class Reference

Container class for the data associated with a single level of communicator partitioning.

### 43.104.1 Detailed Description

Class for partitioning multiple levels of parallelism and managing message passing within these levels. The [ParallelLibrary](#) class encapsulates all of the details of performing message passing within multiple levels of parallelism. It provides functions for partitioning of levels according to user configuration input and functions for passing messages within and across MPI communicators for each of the parallelism levels. If support for other message-passing libraries beyond MPI becomes needed (PVM, ...), then [ParallelLibrary](#) would be promoted to a base class with virtual functions to encapsulate the library-specific syntax.

### 43.104.2 Constructor & Destructor Documentation

#### 43.104.2.1 ParallelLibrary (int & argc, char \*\*& argv)

stand-alone mode constructor This constructor is the one used by [main.C](#). It calls MPI\_Init conditionally based on whether a parallel launch is detected.

References Dakota::abort\_handler(), ParallelLibrary::currPLIter, Dakota::Dak\_pl, ParallelLibrary::detect\_parallel\_launch(), ParallelLibrary::increment\_parallel\_configuration(), ParallelLibrary::mpirunFlag, ParallelLibrary::ownMPIFlag, ParallelLibrary::parallelLevels, ParallelLevel::serverCommRank, ParallelLevel::serverCommSize, ParallelLevel::serverIntraComm, Dakota::start\_dakota\_heartbeat(), ParallelLibrary::startClock, ParallelLibrary::startCPUTime, ParallelLibrary::startMPITime, ParallelLibrary::startWCTime, ParallelLibrary::worldRank, and ParallelLibrary::worldSize.

#### 43.104.2.2 ParallelLibrary ()

default library mode constructor (assumes MPI\_COMM\_WORLD) This constructor provides a library mode default [ParallelLibrary](#). It does not call MPI\_Init, but rather gathers data from MPI\_COMM\_WORLD if MPI\_Init has been called elsewhere.

References ParallelLibrary::dakotaMPIComm, and ParallelLibrary::init\_mpi\_comm().

#### 43.104.2.3 ParallelLibrary (`MPI_Comm dakota_mpi_comm`)

library mode constructor accepting communicator This constructor provides a library mode `ParallelLibrary`, accepting an MPI communicator that might not be `MPI_COMM_WORLD`. It does not call `MPI_Init`, but rather gathers data from `dakota_mpi_comm` if `MPI_Init` has been called elsewhere.

References `ParallelLibrary::dakotaMPIComm`, and `ParallelLibrary::init_mpi_comm()`.

#### 43.104.2.4 ParallelLibrary (`const std::string & dummy`)

dummy constructor (used for `dummy_lib`) This constructor is used for creation of the global `dummy_lib` object, which is used to satisfy initialization requirements when the real `ParallelLibrary` object is not available.

### 43.104.3 Member Function Documentation

#### 43.104.3.1 void specify\_outputs\_restart (`CommandLineHandler & cmd_line_handler`)

specify output streams and restart file(s) using command line inputs (normal mode) On the rank 0 processor, get the -output, -error, -read\_restart, and -write\_restart filenames and the -stop\_restart limit from the command line. Defaults for the filenames from the command line handler are NULL for the filenames except write which defaults to `dakota.rst` and 0 for `read_restart_evals` if no user specification. This information is Bcast from rank 0 to all iterator masters in `manage_outputs_restart()`.

References `ParallelLibrary::manage_run_modes()`, `CommandLineHandler::read_restart_evals()`, `ParallelLibrary::readRestartFilename`, `GetLongOpt::retrieve()`, `ParallelLibrary::stdErrorFilename`, `ParallelLibrary::stdOutputFilename`, `ParallelLibrary::stopRestartEvals`, `ParallelLibrary::worldRank`, and `ParallelLibrary::writeRestartFilename`.

Referenced by `main()`, and `run_dakota()`.

#### 43.104.3.2 void specify\_outputs\_restart (`const char * clh_std_output_filename = NULL, const char * clh_std_error_filename = NULL, const char * clh_read_restart_filename = NULL, const char * clh_write_restart_filename = NULL, int stop_restart_evals = 0, bool pre_run_flag = false`)

specify output streams and restart file(s) using external inputs (library mode). Rather than extracting from the command line, pass the std output, std error, read restart, and write restart filenames and the stop restart limit directly. This function only needs to be invoked to specify non-default values [defaults for the filenames are NULL (resulting in no output redirection, no restart read, and default restart write) and 0 for the stop restart limit (resulting in no restart read limit)].

References `ParallelLibrary::postRunFlag`, `ParallelLibrary::preRunFlag`, `ParallelLibrary::readRestartFilename`, `ParallelLibrary::runFlag`, `ParallelLibrary::stdErrorFilename`, `ParallelLibrary::stdOutputFilename`, `ParallelLibrary::stopRestartEvals`, `ParallelLibrary::userModesFlag`, and `ParallelLibrary::writeRestartFilename`.

#### 43.104.3.3 void manage\_outputs\_restart (`const ParallelLevel & pl`)

manage output streams and restart file(s) (both modes) If the user has specified the use of files for DAKOTA standard output and/or standard error, then bind these filenames to the `Cout/Cerr` macros. In addition, if concurrent

iterators are to be used, create and tag multiple output streams in order to prevent jumbled output. Manage restart file(s) by processing any incoming evaluations from an old restart file and by setting up the binary output stream for new evaluations. Only master iterator processor(s) read & write restart information. This function must follow init\_iterator\_communicators so that restart can be managed properly for concurrent iterator strategies. In the case of concurrent iterators, each iterator has its own restart file tagged with iterator number.

*inequality operator*

## 43.105.1 Detailed Description

Container class for a variables object, a response object, and an evaluation id. `ParamResponsePair` provides a container class for association of the input for a particular function evaluation (a variables object) with the output from this function evaluation (a response object), along with an evaluation identifier. This container defines the basic unit used in the data\_pairs cache, in restart file operations, and in a variety of scheduling algorithm queues. With the advent of STL, replacement of arrays of this class with map<> and pair<> template constructs may be possible (using map<pair<int, String>, pair<Variables, Response>>, for example), assuming that deep copies, I/O, alternate constructors, etc., can be adequately addressed. Boost tuple<> may also be a candidate.

## 43.105.2 Constructor & Destructor Documentation

### 43.105.2.1 `ParamResponsePair (const Variables & vars, const String & interface_id, const Response & response, bool deep_copy = false) [inline]`

alternate constructor for temporaries Uses of this constructor often employ the standard `Variables` and `Response` copy constructors to share representations since this constructor is commonly used for search\_pairs (which are local instantiations that go out of scope prior to any changes to values; i.e., they are not used for history).

### 43.105.2.2 `ParamResponsePair (const Variables & vars, const String & interface_id, const Response & response, const int eval_id, bool deep_copy = true) [inline]`

standard constructor for history uses Uses of this constructor often do not share representations since deep copies are used when history mechanisms (e.g., data\_pairs and beforeSynchCorePRPQueue) are involved.

## 43.105.3 Member Function Documentation

### 43.105.3.1 `void read (MPIUnpackBuffer & s) [inline]`

read a `ParamResponsePair` object from a packed MPI buffer interfaceId is omitted since master processor retains interface ids and communicates asv and response data only with slaves.

References `ParamResponsePair::evalInterfaceIds`, `ParamResponsePair::prPairParameters`, and `ParamResponsePair::prPairResponse`.

**43.105.3.2 void write (MPIPackBuffer & s) const [inline]**

write a [ParamResponsePair](#) object to a packed MPI buffer interfaceId is omitted since master processor retains interface ids and communicates asv and response data only with slaves.

References [ParamResponsePair::evalInterfaceIds](#), [ParamResponsePair::prPairParameters](#), and [ParamResponsePair::prPairResponse](#).

## 43.105.4 Member Data Documentation

### 43.105.4.1 IntStringPair evalInterfaceIds [private]

the evalInterfaceIds aggregate the function evaluation identifier (assigned from [Interface::evalIdCntr](#)) is paired with the interface used to generate the response object. Used in PRPCache id\_vars\_set\_compare to prevent duplicate detection on results from different interfaces. evalInterfaceIds belongs here rather than in [Response](#) since some [Response](#) objects involve consolidation of several fn evals (e.g., [Model::synchronize\\_derivatives\(\)](#)) that are not, in total, generated by a single interface. The prPair, on the other hand, is used for storage of all low level fn evals that get evaluated in [ApplicationInterface::map\(\)](#).

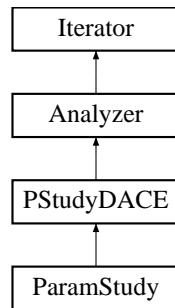

Referenced by [ParamResponsePair::eval\\_id\(\)](#), [ParamResponsePair::eval\\_interface\\_ids\(\)](#), [ParamResponsePair::interface\\_id\(\)](#), [ParamResponsePair::operator=\(\)](#), [Dakota::operator==\(\)](#), [ParamResponsePair::read\(\)](#), [ParamResponsePair::read\\_annotated\(\)](#), [ParamResponsePair::write\(\)](#), [ParamResponsePair::write\\_annotated\(\)](#), and [ParamResponsePair::write\\_tabular\(\)](#).

*number of partitions for each variable in a multidim\_parameter\_study*

### 43.106.1 Detailed Description

Class for vector, list, centered, and multidimensional parameter studies. The [ParamStudy](#) class contains several algorithms for performing parameter studies of different types. The vector parameter study steps along an n-dimensional vector from an arbitrary initial point to an arbitrary final point in a specified number of steps. The centered parameter study performs a number of plus and minus offsets in each coordinate direction around a center point. A multidimensional parameter study fills an n-dimensional hypercube based on bounds and a specified number of partitions for each dimension. And the list parameter study provides for a user specification of a list of points to evaluate, which allows general parameter investigations not fitting the structure of vector, centered, or multidim parameter studies.

### 43.106.2 Member Function Documentation

#### 43.106.2.1 void [pre\\_run \(\) \[virtual\]](#)

pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all [Variables](#) (parameter sets) a priori pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [pre\\_run\(\)](#), if implemented, typically \_before\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References Dakota::abort\_handler(), Analyzer::allHeaders, Analyzer::allVariables, ParamStudy::centered\_loop(), Model::continuous\_variables(), ParamStudy::contStepVector, Dakota::copy\_data(), Model::current\_variables(), Model::discrete\_int\_variables(), Model::discrete\_real\_variables(), ParamStudy::discStepVector, ParamStudy::distribute\_partitions(), ParamStudy::final\_point\_to\_step\_vector(), ParamStudy::finalPoint, ParamStudy::initialCVPoint, ParamStudy::initialDIVPoint, ParamStudy::initialDRVPoint, Iterator::iteratedModel, ParamStudy::multidim\_loop(), ParamStudy::numEvals, ParamStudy::numSteps, Iterator::outputLevel, ParamStudy::pStudyType, ParamStudy::sample(), Variables::shared\_data(), ParamStudy::stepsPerVariable, ParamStudy::variablePartitions, ParamStudy::vector\_loop(), Dakota::write\_data(), and ParamStudy::write\_ordered().

### 43.106.2.2 void post\_run (std::ostream & s) [virtual]

post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [post\\_run\(\)](#), typically after performing its own implementation steps.

Reimplemented from [Iterator](#).

### 43.109.1 Detailed Description

Derived approximation class for global basis polynomials. The [PecosApproximation](#) class provides a global approximation based on basis polynomials. This includes orthogonal polynomials used for polynomial chaos expansions and interpolation polynomials used for stochastic collocation.

### 43.109.2 Member Function Documentation

#### 43.109.2.1 void build () [inline, protected, virtual]

builds the approximation from scratch This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References PecosApproximation::pecosBasisApprox.

#### 43.109.2.2 void rebuild () [inline, protected, virtual]

rebuids the approximation incrementally This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References PecosApproximation::pecosBasisApprox.

#### 43.109.2.3 void pop (bool save\_data) [inline, protected, virtual]

removes entries from end of SurrogateData::{vars,resp}Data (last points appended) This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References PecosApproximation::pecosBasisApprox.

#### 43.109.2.4 void restore () [inline, protected, virtual]

restores state prior to previous append() This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References PecosApproximation::pecosBasisApprox.

**43.109.2.5 void finalize () [inline, protected, virtual]**

finalize approximation by applying all remaining trial sets This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

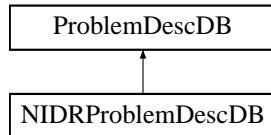

References PecosApproximation::pecosBasisApprox.

The documentation for this class was generated from the following files:

- PecosApproximation.H
- PecosApproximation.C

## 43.110 ProblemDescDB Class Reference

The database containing information parsed from the DAKOTA input file. Inheritance diagram for ProblemDescDB::

### Public Member Functions

- **ProblemDescDB ()**  
*default constructor*
- **ProblemDescDB (ParallelLibrary &parallel\_lib)**  
*standard constructor*
- **ProblemDescDB (const ProblemDescDB &db)**  
*copy constructor*
- **~ProblemDescDB ()**  
*destructor*
- **ProblemDescDB operator= (const ProblemDescDB &db)**  
*assignment operator*
- **void manage\_inputs (CommandLineHandler &cmd\_line\_handler)**  
*invokes manage\_inputs(const char\*, ...) using the dakota input filename passed with the "-input" option on the DAKOTA command line. This is the normal API employed in main.C.*
- **void manage\_inputs (const char \*dakota\_input\_file, const char \*parser\_options=NULL, void(\*callback)(void \*)=NULL, void \*callback\_data=NULL)**  
*invokes parse\_inputs() to populate the problem description database and execute any callback function, broadcast() to propagate DB data to all processors, and post\_process() to construct default variables/response vectors. This is an alternate API used by the file parsing mode in library\_mode.C.*
- **void parse\_inputs (const char \*dakota\_input\_file, const char \*parser\_options=NULL, void(\*callback)(void \*)=NULL, void \*callback\_data=NULL)**  
*parses the input file and populates the problem description database. This function reads from the dakota input filename passed in and allows subsequent modifications to be done by a callback function. This API is used by the mixed mode option in library\_mode.C since it allows broadcast() and post\_process() to be deferred until all inputs have been provided.*
- **void check\_input ()**

*verifies that there is at least one of each of the required keywords in the dakota input file. Used by [parse\\_inputs\(\)](#).*

- **void broadcast ()**  
*invokes [send\\_db\\_buffer\(\)](#) and [receive\\_db\\_buffer\(\)](#) to broadcast DB data across the processor allocation. Used by [manage\\_inputs\(\)](#).*
- **void post\_process ()**  
*post-processes the (minimal) input specification to assign default variables/responses specification arrays. Used by [manage\\_inputs\(\)](#).*
- **void lock ()**  
*Locks the database in order to prevent data access when the list nodes may not be set properly. Unlocked by a set nodes operation.*
- **void unlock ()**  
*Explicitly unlocks the database. Use with care.*
- **void set\_db\_list\_nodes (const String &method\_tag)**  
*set dataMethodIter based on a method identifier string to activate a particular method specification in dataMethodList and use pointers from this method specification to set all other list iterators.*
- **void set\_db\_list\_nodes (const size\_t &method\_index)**  
*set dataMethodIter based on an index within dataMethodList to activate a particular method specification and use pointers from this method specification to set all other list iterators.*
- **void resolve\_top\_method ()**  
*For a (default) strategy lacking a method pointer, this function is used to determine which of several potential method specifications corresponds to the top method and then sets the list nodes accordingly.*
- **void set\_db\_method\_node (const String &method\_tag)**  
*set dataMethodIter based on a method identifier string to activate a particular method specification (only).*
- **void set\_db\_method\_node (const size\_t &method\_index)**  
*set dataMethodIter based on an index within dataMethodList to activate a particular method specification (only).*
- **size\_t get\_db\_method\_node ()**  
*return the index of the active node in dataMethodList*
- **void set\_db\_model\_nodes (const String &model\_tag)**  
*set the model list iterators (dataModelIter, dataVariablesIter, dataInterfaceIter, and dataResponsesIter) based on the model identifier string*
- **void set\_db\_model\_nodes (const size\_t &model\_index)**  
*set the model list iterators (dataModelIter, dataVariablesIter, dataInterfaceIter, and dataResponsesIter) based on an index within dataModelList*
- **size\_t get\_db\_model\_node ()**

*return the index of the active node in dataModelList*

- void **set\_db\_variables\_node** (const **String** &variables\_tag)  
*set dataVariablesIter based on the variables identifier string*
- void **set\_db\_interface\_node** (const **String** &interface\_tag)  
*set dataInterfaceIter based on the interface identifier string*
- void **set\_db\_responses\_node** (const **String** &responses\_tag)  
*set dataResponsesIter based on the responses identifier string*
- **ParallelLibrary** & **parallel\_library** () const  
*return the parallelLib reference*

### 43.110.1 Detailed Description

The database containing information parsed from the DAKOTA input file. The [ProblemDescDB](#) class is a database for DAKOTA input file data that is populated by a parser defined in a derived class. When the parser reads a complete keyword, it populates a data class object ([DataStrategy](#), [DataMethod](#), [DataVariables](#), [DataInterface](#), or [DataResponses](#)) and, for all cases except strategy, appends the object to a linked list (dataMethodList, dataVariablesList, dataInterfaceList, or dataResponsesList). No strategy linked list is used since only one strategy specification is allowed.

### 43.110.2 Constructor & Destructor Documentation

#### 43.110.2.1 ProblemDescDB ()

default constructor The default constructor: dbRep is NULL in this case. This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

#### 43.110.2.2 ProblemDescDB (*ParallelLibrary & parallel\_lib*)

standard constructor This is the envelope constructor which uses problem\_db to build a fully populated db object. It only needs to extract enough data to properly execute `get_db(problem_db)`, since the constructor overloaded with [BaseConstructor](#) builds the actual base class data inherited by the derived classes.

References `Dakota::abort_handler()`, `ProblemDescDB::dbRep`, and `ProblemDescDB::get_db()`.

#### 43.110.2.3 ProblemDescDB (*const ProblemDescDB & db*)

copy constructor Copy constructor manages sharing of dbRep and incrementing of referenceCount.

References `ProblemDescDB::dbRep`, and `ProblemDescDB::referenceCount`.

**43.110.2.4 ~ProblemDescDB ()**

destructor Destructor decrements referenceCount and only deletes dbRep when referenceCount reaches zero.

References Dakota::Dak\_pddb, ProblemDescDB::dbRep, and ProblemDescDB::referenceCount.

**43.110.2.5 ProblemDescDB (BaseConstructor, ParallelLibrary & parallel\_lib) [protected]**

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get\\_db\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_db\(\)](#) again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~ProblemDescDB).

**43.110.3 Member Function Documentation****43.110.3.1 ProblemDescDB operator= (const ProblemDescDB & db)**

assignment operator Assignment operator decrements referenceCount for old dbRep, assigns new dbRep, and increments referenceCount for new dbRep.

References ProblemDescDB::dbRep, and ProblemDescDB::referenceCount.

**43.110.3.2 void manage\_inputs (CommandLineHandler & cmd\_line\_handler)**

invokes [manage\\_inputs\(const char\\*, ...\)](#) using the dakota input filename passed with the "-input" option on the DAKOTA command line. This is the normal API employed in [main.C](#). Manage command line inputs using the [CommandLineHandler](#) class and parse the input file.

References ProblemDescDB::dbRep, ProblemDescDB::manage\_inputs(), ProblemDescDB::parallelLib, GetLongOpt::retrieve(), and ParallelLibrary::world\_rank().

Referenced by [main\(\)](#), [ProblemDescDB::manage\\_inputs\(\)](#), [run\\_dakota\(\)](#), and [run\\_dakota\\_parse\(\)](#).

**43.110.3.3 void manage\_inputs (const char \* dakota\_input\_file, const char \* parser\_options = NULL, void(\*)(void \*) callback = NULL, void \* callback\_data = NULL)**

invokes [parse\\_inputs\(\)](#) to populate the problem description database and execute any callback function, [broadcast\(\)](#) to propagate DB data to all processors, and [post\\_process\(\)](#) to construct default variables/response vectors. This is an alternate API used by the file parsing mode in [library\\_mode.C](#). Parse the input file, broadcast it to all processors, and post-process the data on all processors.

References [ProblemDescDB::broadcast\(\)](#), [ProblemDescDB::dbRep](#), [ProblemDescDB::manage\\_inputs\(\)](#), [ProblemDescDB::parse\\_inputs\(\)](#), and [ProblemDescDB::post\\_process\(\)](#).

**43.110.3.4 void parse\_inputs (const char \* *dakota\_input\_file*, const char \* *parser\_options* = NULL,  
void(\*)(void \*) *callback* = NULL, void \* *callback\_data* = NULL)**

parses the input file and populates the problem description database. This function reads from the dakota input filename passed in and allows subsequent modifications to be done by a callback function. This API is used by the mixed mode option in [library\\_mode.C](#) since it allows [broadcast\(\)](#) and [post\\_process\(\)](#) to be deferred until all inputs have been provided. Parse the input file, execute the callback function (if present), and perform basic checks on keyword counts.

References ProblemDescDB::check\_input(), ProblemDescDB::dbRep, ProblemDescDB::derived\_parse\_inputs(), ProblemDescDB::parallelLib, ProblemDescDB::parse\_inputs(), and ParallelLibrary::world\_rank().

Referenced by ProblemDescDB::manage\_inputs(), ProblemDescDB::parse\_inputs(), and run\_dakota\_mixed().

**43.110.3.5 void post\_process ()**

post-processes the (minimal) input specification to assign default variables/responses specification arrays. Used by [manage\\_inputs\(\)](#). When using library mode in a parallel application, [post\\_process\(\)](#) should be called on all processors following [broadcast\(\)](#) of a minimal problem specification.

References ProblemDescDB::dbRep, and ProblemDescDB::derived\_post\_process().

Referenced by ProblemDescDB::manage\_inputs(), Dakota::run\_dakota\_data(), and run\_dakota\_mixed().

**43.110.3.6 ProblemDescDB \* get\_db (ParallelLibrary & *parallel\_lib*) [private]**

Used by the envelope constructor to instantiate the correct letter class. Initializes dbRep to the appropriate derived type. The standard derived class constructors are invoked.

References Dakota::Dak\_pddb.

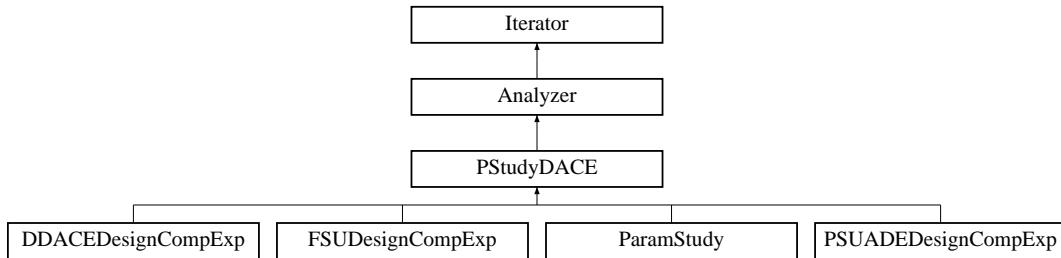

Referenced by ProblemDescDB::ProblemDescDB().

The documentation for this class was generated from the following files:

### 43.111.1 Detailed Description

Base class for managing common aspects of parameter studies and design of experiments methods. The [PStudy-DACE](#) base class manages common data and functions, such as those involving the best solutions located during the parameter set evaluations or the printing of final results.

### 43.111.2 Member Function Documentation

#### 43.111.2.1 void run () [[inline](#), [protected](#), [virtual](#)]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References [Analyzer::bestVarsRespMap](#), and [PStudyDACE::extract\\_trends\(\)](#).

#### 43.111.2.2 void print\_results (std::ostream & s) [[protected](#), [virtual](#)]

print the final iterator results This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in [finalize\\_run\(\)](#).

Reimplemented from [Analyzer](#).

*current seed for the random number generator*

### 43.112.1 Detailed Description

Wrapper class for the PSUADE library. The [PSUADEDesignCompExp](#) class provides a wrapper for PSUADE, a C++ design of experiments library from Lawrence Livermore National Laboratory. Currently this class only includes the PSUADE Morris One-at-a-time (MOAT) method to uniformly sample the parameter space spanned by the active bounds of the current [Model](#). It returns all generated samples and their corresponding responses as well as the best sample found.

### 43.112.2 Constructor & Destructor Documentation

#### 43.112.2.1 [PSUADEDesignCompExp](#) ([Model](#) & *model*)

primary constructor for building a standard DACE iterator This constructor is called for a standard iterator built with data from probDescDB.

References Dakota::abort\_handler(), Iterator::maxConcurrency, Iterator::methodName, and PSUADEDesignCompExp::numSamples.

### 43.112.3 Member Function Documentation

#### 43.112.3.1 [void pre\\_run \(\) \[virtual\]](#)

pre-run portion of run\_iterator (optional); re-implemented by Iterators which can generate all [Variables](#) (parameter sets) a priori pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [pre\\_run\(\)](#), if implemented, typically \_before\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References PSUADEDesignCompExp::get\_parameter\_sets(), and Iterator::iteratedModel.

#### 43.112.3.2 [void post\\_run \(std::ostream & s\) \[virtual\]](#)

post-run portion of run\_iterator (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's [post\\_run\(\)](#), typically \_after\_ performing its own implementation steps.

Reimplemented from [Iterator](#).

References Dakota::abort\_handler(), Analyzer::allResponses, Analyzer::allSamples, Model::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Iterator::iteratedModel, Iterator::numContinuousVars, Iterator::numFunctions, and PSUADEDesignCompExp::numSamples.

**43.112.3.3 int num\_samples () const [inline, virtual]**

get the current number of samples Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from [Iterator](#).

References PSUADEDesignCompExp::numSamples.

**43.112.3.4 void enforce\_input\_rules () [private]**

enforce sanity checks/modifications for the user input specification Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References Dakota::abort\_handler(), Iterator::methodName, Iterator::numContinuousVars, PSUADEDesignCompExp::numPartitions, PSUADEDesignCompExp::numSamples, and PSUADEDesignCompExp::varPartitionsSpec.

Referenced by PSUADEDesignCompExp::get\_parameter\_sets().

The documentation for this class was generated from the following files:

- PSUADEDesignCompExp.H

*holds pointer for secondary response mapping function passed in ctor/initialize*

### 43.114.1 Detailed Description

Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs. The [RecastModel](#) class uses function pointers to allow recasting of the subModel input/output into new problem forms. This is currently used to recast SBO approximate subproblems, but can be used for multiobjective, input/output scaling, and other problem modifications in the future.

### 43.114.2 Constructor & Destructor Documentation

**43.114.2.1 RecastModel (const Model & *sub\_model*, const Sizet2DArray & *vars\_map\_indices*, const SizetArray & *vars\_comps\_totals*, bool *nonlinear\_vars\_mapping*, void(\*)(&  
Variables &recast\_vars, Variables &*sub\_model\_vars*) *variables\_map*, void(\*)(&  
Variables &recast\_vars, const ActiveSet &recast\_set, ActiveSet &*sub\_model\_set*)  
*set\_map*, const Sizet2DArray & *primary\_resp\_map\_indices*, const Sizet2DArray &  
*secondary\_resp\_map\_indices*, size\_t *recast\_secondary\_offset*, const BoolDequeArray &  
*nonlinear\_resp\_mapping*, void(\*)(&  
Variables &*sub\_model\_vars*, const Variables  
&recast\_vars, const Response &*sub\_model\_response*, Response &recast\_response)  
*primary\_resp\_map*, void(\*)(&  
Variables &*sub\_model\_vars*, const Variables &recast\_vars,  
const Response &*sub\_model\_response*, Response &recast\_response) *secondary\_resp\_map*)**

standard constructor Default recast model constructor. Requires full definition of the transformation. Parameter *vars\_comps\_totals* indicates the number of each type of variable {4 types} x {3 domains} in the recast variable space

References Dakota::abort\_handler(), Constraints::copy(), Response::copy(), Variables::copy(), Model::current\_response(), Model::current\_variables(), Model::currentResponse, Model::currentVariables, Variables::cv(), Response::function\_gradients(), Response::function\_hessians(), RecastModel::initialize\_data\_from\_submodel(), RecastModel::nonlinearRespMapping, Response::num\_functions(), Model::num\_functions(), Constraints::num\_linear\_eq\_constraints(), Constraints::num\_linear\_ineq\_constraints(), Constraints::num\_nonlinear\_eq\_constraints(), Constraints::num\_nonlinear\_ineq\_constraints(), Model::numDerivVars, Model::numFns, RecastModel::primaryRespMapIndices, RecastModel::primaryRespMapping, Constraints::reshape(), Response::reshape(), RecastModel::respMapping, RecastModel::secondaryRespMapIndices, RecastModel::secondaryRespMapping, RecastModel::subModel, Model::user\_defined\_constraints(), Model::userDefinedConstraints, Variables::variables\_components\_totals(), RecastModel::variablesMapping, and Variables::view().

**43.114.2.2 RecastModel (const Model & *sub\_model*, const SizetArray & *vars\_comps\_totals*, size\_t *num\_recast\_primary\_fns*, size\_t *num\_recast\_secondary\_fns*, size\_t *recast\_secondary\_offset*)**

alternate constructor This alternate constructor defers initialization of the function pointers until a separate call to [initialize\(\)](#), and accepts the minimum information needed to construct currentVariables, currentResponse, and userDefinedConstraints. The resulting model is sufficiently complete for passing to an [Iterator](#). Parameter *vars\_comps\_totals* indicates the number of each type of variable {4 types} x {3 domains} in the recast variable space

References Constraints::copy(), Response::copy(), Variables::copy(), Model::current\_response(), Model::current\_variables(), Model::currentResponse, Model::currentVariables, Variables::cv(), Response::function\_gradients(), Response::function\_hessians(), RecastModel::initialize\_data\_from\_submodel(), Model::num\_functions(), Constraints::num\_linear\_eq\_constraints(), Constraints::num\_linear\_ineq\_constraints(), Constraints::num\_nonlinear\_eq\_constraints(), Constraints::num\_nonlinear\_ineq\_constraints(),

*inequality operator*

### 43.115.1 Detailed Description

Container class for response functions and their derivatives. `Response` provides the handle class. The `Response` class is a container class for an abstract set of functions (`functionValues`) and their first (`functionGradients`) and second (`functionHessians`) derivatives. The functions may involve objective and constraint functions (optimization data set), least squares terms (parameter estimation data set), or generic response functions (uncertainty quantification data set). It is not currently part of a class hierarchy, since the abstraction has been sufficiently general and has not required specialization. For memory efficiency, it employs the "handle-body idiom" approach to reference counting and representation sharing (see Coplien "Advanced C++", p. 58), for which `Response` serves as the handle and `ResponseRep` serves as the body.

### 43.115.2 Constructor & Destructor Documentation

#### 43.115.2.1 `Response()`

default constructor Need a populated problem description database to build a meaningful `Response` object, so set the `responseRep=NULL` in default constructor for efficiency. This then requires a check on `NULL` in the copy constructor, assignment operator, and destructor.

The documentation for this class was generated from the following files:

- DakotaResponse.H
- DakotaResponse.C

## 43.116 ResponseRep Class Reference

Container class for response functions and their derivatives. [ResponseRep](#) provides the body class.

### Private Member Functions

## Private Attributes

- int [referenceCount](#)  
*number of handle objects sharing responseRep*

- RealVector [functionValues](#)  
*abstract set of response functions*
- RealMatrix [functionGradients](#)  
*first derivatives of the response functions*
- RealSymMatrixArray [functionHessians](#)  
*second derivatives of the response functions*
- ActiveSet [responseActiveSet](#)  
*copy of the ActiveSet used by the Model to generate a Response instance*
- StringArray [functionLabels](#)  
*response function identifiers used to improve output readability*
- String [responsesId](#)  
*response identifier string from the input file*

## Friends

- class [Response](#)  
*the handle class can access attributes of the body class directly*
- bool [operator==](#) (const [ResponseRep](#) &rep1, const [ResponseRep](#) &rep2)  
*equality operator*

## 43.116.1 Detailed Description

Container class for response functions and their derivatives. [ResponseRep](#) provides the body class. The [ResponseRep](#) class is the "representation" of the response container class. It is the "body" portion of the "handle-body idiom" (see Coplien "Advanced C++", p. 58). The handle class ([Response](#)) provides for memory efficiency in management of multiple response objects through reference counting and representation sharing. The body class ([ResponseRep](#)) actually contains the response data (functionValues, functionGradients, functionHessians, etc.). The representation is hidden in that an instance of [ResponseRep](#) may only be created by [Response](#). Therefore, programmers create instances of the [Response](#) handle class, and only need to be aware of the handle/body mechanisms when it comes to managing shallow copies (shared representation) versus deep copies (separate representation used for history mechanisms).

## 43.116.2 Constructor & Destructor Documentation

### 43.116.2.1 ResponseRep (const Variables & vars, const ProblemDescDB & problem\_db) [private]

standard constructor built from problem description database The standard constructor used by Dakota::ModelRep.

References Dakota::abort\_handler(), Variables::continuous\_variable\_ids(), Variables::cv(), ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, ProblemDescDB::get\_sizet(), ProblemDescDB::get\_string(), ActiveSet::request\_vector(), and ResponseRep::responseActiveSet.

#### 43.116.2.2 ResponseRep (const ActiveSet & set) [private]

alternate constructor using limited data Used for building a response object of the correct size on the fly (e.g., by slave analysis servers performing execute() on a local\_response). functionLabels is not needed for this purpose since it's not passed in the MPI send/recv buffers. However, NPSOLOptimizer's user-defined functions option uses this constructor to build bestResponseArray.front() and bestResponseArray.front() needs functionLabels for I/O, so construction of functionLabels has been added.

References Dakota::build\_labels(), ResponseRep::functionGradients, ResponseRep::functionHessians, and ResponseRep::functionLabels.

### 43.116.3 Member Function Documentation

#### 43.116.3.1 void read (std::istream & s) [private]

read a responseRep object from an std::istream ASCII version of read needs capabilities for capturing data omissions or formatting errors (resulting from user error or asynch race condition) and analysis failures (resulting from nonconvergence, instability, etc.).

References ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, Dakota::re\_match(), Dakota::read\_col\_vector\_trans(), ResponseRep::read\_data(), ActiveSet::request\_vector(), ResponseRep::reset(), and ResponseRep::responseActiveSet.

Referenced by Response::read().

#### 43.116.3.2 void write (std::ostream & s) const [private]

write a responseRep object to an std::ostream ASCII version of write.

References Dakota::abort\_handler(), Dakota::array\_write\_annotated(), ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionLabels, ResponseRep::functionValues, ActiveSet::request\_vector(), ResponseRep::responseActiveSet, Dakota::write\_col\_vector\_trans(), ResponseRep::write\_data(), and Dakota::write\_precision.

Referenced by Response::write().

#### 43.116.3.3 void read\_annotated (std::istream & s) [private]

read a responseRep object from an std::istream (annotated format [read\\_annotated\(\)](#)) is used for neutral file translation of restart files. Since objects are built solely from this data, annotations are used. This version closely mirrors the [BiStream](#) version.

References ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionLabels, ResponseRep::functionValues, Dakota::read\_col\_vector\_trans(), ResponseRep::read\_data(), ActiveSet::request\_

`vector()`, `ResponseRep::reset()`, `ResponseRep::reshape()`, `ActiveSet::reshape()`, and `ResponseRep::responseActiveSet`.

Referenced by `Response::read_annotated()`.

#### **43.116.3.4 void write\_annotated (std::ostream & s) const [private]**

write a responseRep object to an std::ostream (annotated format) `write_annotated()` is used for neutral file translation of restart files. Since objects need to be build solely from this data, annotations are used. This version closely mirrors the `BoStream` version, with the exception of the use of white space between fields.

References `Dakota::array_write_annotated()`, `ActiveSet::derivative_vector()`, `ResponseRep::functionGradients`, `ResponseRep::functionHessians`, `ResponseRep::functionLabels`, `ResponseRep::functionValues`, `ActiveSet::request_vector()`, `ResponseRep::responseActiveSet`, `ActiveSet::write_annotated()`, `Dakota::write_col_vector_trans()`, and `ResponseRep::write_data()`.

Referenced by `Response::write_annotated()`.

#### **43.116.3.5 void read\_tabular (std::istream & s) [private]**

read functionValues from an std::istream (tabular format) `read_tabular` is used to read functionValues in tabular format. It is currently only used by ApproximationInterfaces in reading samples from a file. There is insufficient data in a tabular file to build complete response objects; rather, the response object must be constructed a priori and then its functionValues can be set.

References `ResponseRep::functionValues`.

Referenced by `Response::read_tabular()`.

#### **43.116.3.6 void write\_tabular (std::ostream & s) const [private]**

write functionValues to an std::ostream (tabular format) `write_tabular` is used for output of functionValues in a tabular format for convenience in post-processing/plotting of DAKOTA results.

References `ResponseRep::functionValues`, `ActiveSet::request_vector()`, `ResponseRep::responseActiveSet`, and `Dakota::write_precision`.

Referenced by `Response::write_tabular()`.

#### **43.116.3.7 void read (BiStream & s) [private]**

read a responseRep object from a binary stream Binary version differs from ASCII version in 2 primary ways: (1) it lacks formatting. (2) the `Response` has not been sized a priori. In reading data from the binary restart file, a `ParamResponsePair` was constructed with its default constructor which called the `Response` default constructor. Therefore, we must first read sizing data and resize all of the arrays.

References `ResponseRep::functionGradients`, `ResponseRep::functionHessians`, `ResponseRep::functionLabels`, `ResponseRep::functionValues`, `Dakota::read_col_vector_trans()`, `ResponseRep::read_data()`, `ActiveSet::request_vector()`, `ResponseRep::reset()`, `ResponseRep::reshape()`, and `ResponseRep::responseActiveSet`.

**43.116.3.8 void write (BoStream & s) const [private]**

write a responseRep object to a binary stream Binary version differs from ASCII version in 2 primary ways: (1) It lacks formatting. (2) In reading data from the binary restart file, ParamResponsePairs are constructed with their default constructor which calls the [Response](#) default constructor. Therefore, we must first write sizing data so that ResponseRep::read(BoStream& s) can resize the arrays.

References ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionLabels, ResponseRep::functionValues, ActiveSet::request\_vector(), ResponseRep::responseActiveSet, Dakota::write\_col\_vector\_trans(), and ResponseRep::write\_data().

**43.116.3.9 void read (MPIUnpackBuffer & s) [private]**

read a responseRep object from a packed MPI buffer UnpackBuffer version differs from [BiStream](#) version in the omission of functionLabels. Master processor retains labels and interface ids and communicates asv and response data only with slaves.

References ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, Dakota::read\_col\_vector\_trans(), ResponseRep::read\_data(), ResponseRep::reset(), ResponseRep::reshape(), and ResponseRep::responseActiveSet.

**43.116.3.10 void write (MPIPackBuffer & s) const [private]**

write a responseRep object to a packed MPI buffer [MPIPackBuffer](#) version differs from [BoStream](#) version only in the omission of functionLabels. The master processor retains labels and ids and communicates asv and response data only with slaves.

References ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, ActiveSet::request\_vector(), ResponseRep::responseActiveSet, Dakota::write\_col\_vector\_trans(), and ResponseRep::write\_data().

**43.116.3.11 void update (const RealVector & source\_fn\_vals, const RealMatrix & source\_fn\_grads, const RealSymMatrixArray & source\_fn\_hessians, const ActiveSet & source\_set) [private]**

update this response object from components of another response object Copy function values/gradients/Hessians data \_only\_. Prevents unwanted overwriting of responseActiveSet, functionLabels, etc. Also, care is taken to account for differences in derivative variable matrix sizing.

References Dakota::abort\_handler(), ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, ActiveSet::request\_vector(), ResponseRep::reset\_inactive(), and ResponseRep::responseActiveSet.

Referenced by Response::update().

---

**43.116.3.12 void update\_partial (size\_t start\_index\_target, size\_t num\_items, const RealVector & source\_fn\_vals, const RealMatrix & source\_fn\_grads, const RealSymMatrixArray & source\_fn\_hessians, const ActiveSet & source\_set, size\_t start\_index\_source) [private]**

partially update this response object partial components of another response object Copy function values/gradients/Hessians data *\_only\_*. Prevents unwanted overwriting of responseActiveSet, functionLabels, etc. Also, care is taken to account for differences in derivative variable matrix sizing.

References Dakota::abort\_handler(), ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, ActiveSet::request\_vector(), ResponseRep::reset\_inactive(), and ResponseRep::responseActiveSet.

Referenced by Response::update\_partial().

**43.116.3.13 void reshape (const size\_t & num\_fns, const size\_t & num\_params, bool grad\_flag, bool hess\_flag) [private]**

releases response data arrays Reshape functionValues, functionGradients, and functionHessians according to num\_fns, num\_params, grad\_flag, and hess\_flag.

References Dakota::build\_labels(), ActiveSet::derivative\_vector(), ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionLabels, ResponseRep::functionValues, ActiveSet::request\_vector(), ActiveSet::reshape(), and ResponseRep::responseActiveSet.

Referenced by ResponseRep::active\_set\_derivative\_vector(), ResponseRep::read(), ResponseRep::read\_annotated(), and Response::reshape().

**43.116.3.14 void reset () [private]**

resets all response data to zero Reset all numerical response data (not labels, ids, or active set) to zero.

References ResponseRep::functionGradients, ResponseRep::functionHessians, and ResponseRep::functionValues.

Referenced by ResponseRep::read(), ResponseRep::read\_annotated(), and Response::reset().

**43.116.3.15 void reset\_inactive () [private]**

resets all inactive response data to zero Used to clear out any inactive data left over from previous evaluations.

References ResponseRep::functionGradients, ResponseRep::functionHessians, ResponseRep::functionValues, ActiveSet::request\_vector(), and ResponseRep::responseActiveSet.

Referenced by Response::reset\_inactive(), ResponseRep::update(), and ResponseRep::update\_partial().

## 43.116.4 Member Data Documentation

**43.116.4.1 RealMatrix functionGradients [private]**

first derivatives of the response functions the gradient vectors (plural) are column vectors in the matrix (singular) with (row, col) = (variable index, response fn index).

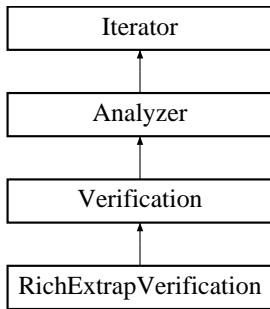

Referenced by ResponseRep::active\_set\_derivative\_vector(), Response::copy(), Response::function\_gradient(), Response::function\_gradient\_copy(), Response::function\_gradient\_view(), Response::function\_gradients(), Response::function\_gradients\_view(), Dakota::operator==(), ResponseRep::overlay(), ResponseRep::read(), ResponseRep::read\_annotated(), ResponseRep::read\_data(), ResponseRep::reset(), ResponseRep::reset\_inactive(), ResponseRep::reshape(), ResponseRep::ResponseRep(), ResponseRep::update(), ResponseRep::update\_partial(), ResponseRep::write(), ResponseRep::write\_annotated(), and ResponseRep::write\_data().

The documentation for this class was generated from the following files:

- DakotaResponse.H
- DakotaResponse.C

## 43.117 RichExtrapVerification Class Reference

Class for Richardson extrapolation for code and solution verification. Inheritance diagram for RichExtrapVerification::

### Public Member Functions

- `RichExtrapVerification (Model &model)`  
*constructor*
- `~RichExtrapVerification ()`  
*destructor*
- `void perform_verification ()`  
*Redefines the run\_iterator virtual function for the PStudy/DACE branch.*
- `void print_results (std::ostream &s)`  
*print the final iterator results*

### Private Member Functions

- `void estimate_order ()`  
*perform a single estimation of convOrder using extrapolation()*
- `void converge_order ()`  
*iterate using extrapolation() until convOrder stabilizes*
- `void converge_qoi ()`  
*iterate using extrapolation() until QOIs stabilize*
- `void extrapolation (const RealVector &refine_triple, RealMatrix &qoi_triples)`  
*estimate convOrder from refinement and quantity of interest (QOI) triples*
- `void extrapolate_result (const RealVector &refine_triple, const RealMatrix &qoi_triples)`

*predict the converged value based on the convergence rate and the value of Phi*

## Private Attributes

- short `studyType`  
*internal code for extrapolation study type: ESTIMATE\_ORDER, CONVERGE\_ORDER, or CONVERGE\_QOI*
- size\_t `numFactors`  
*number of refinement factors defined from active state variables*
- RealVector `initialCVars`  
*initial reference values for refinement factors*
- size\_t `factorIndex`  
*the index of the active factor*
- Real `refinementRate`  
*rate of mesh refinement (default = 2.)*
- RealMatrix `convOrder`  
*the orders of convergence of the QOIs (numFunctions by numFactors)*
- RealMatrix `extrapQOI`  
*the extrapolated value of the QOI (numFunctions by numFactors)*
- RealMatrix `numErrorQOI`  
*the numerical uncertainty associated with level of refinement (numFunctions by numFactors)*
- RealVector `refinementRefPt`  
*This is a reference point reported for the converged extrapQOI and numErrorQOI. It currently corresponds to the coarsest mesh in the final refinement triple.*

### 43.117.1 Detailed Description

Class for Richardson extrapolation for code and solution verification. The `RichExtrapVerification` class contains several algorithms for performing Richardson extrapolation.

### 43.117.2 Member Function Documentation

#### 43.117.2.1 void `print_results (std::ostream & s) [virtual]`

print the final iterator results This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in `finalize_run()`.

Reimplemented from [Verification](#).

References Model::continuous\_variable\_labels(), RichExtrapVerification::convOrder, Dakota::copy\_data(), RichExtrapVerification::extrapQOI, Iterator::iteratedModel, RichExtrapVerification::numErrorQOI, RichExtrapVerification::refinementRate, RichExtrapVerification::refinementRefPt, Model::response\_labels(), and Dakota::write\_data().

#### **43.117.2.2 void estimate\_order () [private]**

perform a single estimation of convOrder using [extrapolation\(\)](#) This algorithm executes a single refinement triple and returns convergence order estimates.

References RichExtrapVerification::extrapolate\_result(), RichExtrapVerification::extrapolation(), RichExtrapVerification::extrapQOI, RichExtrapVerification::factorIndex, RichExtrapVerification::initialCVars, RichExtrapVerification::numErrorQOI, RichExtrapVerification::numFactors, Iterator::numFunctions, RichExtrapVerification::refinementRate, and RichExtrapVerification::refinementRefPt.

Referenced by RichExtrapVerification::perform\_verification().

#### **43.117.2.3 void converge\_order () [private]**

iterate using [extrapolation\(\)](#) until convOrder stabilizes This algorithm continues to refine until the convergence order estimate converges.

References Iterator::convergenceTol, RichExtrapVerification::convOrder, Dakota::copy\_data(), RichExtrapVerification::extrapolate\_result(), RichExtrapVerification::extrapolation(), RichExtrapVerification::extrapQOI, RichExtrapVerification::factorIndex, RichExtrapVerification::initialCVars, Iterator::maxIterations, RichExtrapVerification::numErrorQOI, RichExtrapVerification::numFactors, Iterator::numFunctions, Iterator::outputLevel, RichExtrapVerification::refinementRate, RichExtrapVerification::refinementRefPt, and Dakota::write\_data().

Referenced by RichExtrapVerification::perform\_verification().

## 43.118 SensAnalysisGlobal Class Reference

Class for a utility class containing correlation calculations and variance-based decomposition.

### Public Member Functions

- `SensAnalysisGlobal ()`  
*constructor*
- `~SensAnalysisGlobal ()`  
*destructor*
- `void compute_correlations (const VariablesArray &vars_samples, const IntResponseMap &resp_samples)`  
*computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank*
- `void compute_correlations (const RealMatrix &vars_samples, const IntResponseMap &resp_samples)`  
*computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank*
- `bool correlations_computed () const`  
*returns corrComputed to indicate whether `compute_correlations()` has been invoked*
- `void print_correlations (std::ostream &s, StringMultiArrayConstView cv_labels, StringMultiArrayConstView div_labels, StringMultiArrayConstView drv_labels, const StringArray &resp_labels) const`  
*prints the correlations computed in `compute_correlations()`*

### Private Member Functions

- `void simple_corr (RealMatrix &total_data, bool rank_on, const int &num_in)`  
*computes simple correlations*
- `void partial_corr (RealMatrix &total_data, bool rank_on, const int &num_in)`  
*computes partial correlations*

### Static Private Member Functions

- `static bool rank_sort (const int &x, const int &y)`  
*sort algorithm to compute ranks for rank correlations*

## Private Attributes

- RealMatrix `simpleCorr`  
*matrix to hold simple raw correlations*
- RealMatrix `simpleRankCorr`  
*matrix to hold simple rank correlations*
- RealMatrix `partialCorr`  
*matrix to hold partial raw correlations*
- RealMatrix `partialRankCorr`  
*matrix to hold partial rank correlations*
- size\_t `numFns`  
*number of responses*
- size\_t `numVars`  
*number of inputs*
- bool `numericalIssuesRaw`  
*flag indicating numerical issues in partial raw correlation calculations*
- bool `numericalIssuesRank`  
*flag indicating numerical issues in partial rank correlation calculations*
- bool `corrComputed`  
*flag indicating whether correlations have been computed*

## Static Private Attributes

- static RealArray `rawData` = RealArray()  
*array to hold temporary data before sort*

### 43.118.1 Detailed Description

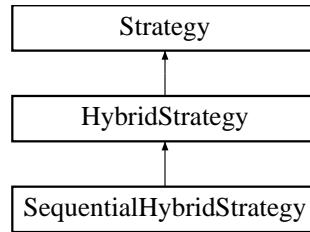

Class for a utility class containing correlation calculations and variance-based decomposition. This class provides code for several of the sampling methods both in the `NonD` branch and in the `PStudyDACE` branch. Currently, the utility functions provide global sensitivity analysis through correlation calculations (e.g. simple, partial, rank, raw) as well as variance-based decomposition.

The documentation for this class was generated from the following files:

- `SensAnalysisGlobal.H`
- `SensAnalysisGlobal.C`

## 43.119 SequentialHybridStrategy Class Reference

*sequential or sequential\_adaptive*
- size\_t [seqCount](#)  
*hybrid sequence counter: 0 to numIterators-1*
- Real [progressMetric](#)  
*the amount of progress made in a single iterator++ cycle within a sequential adaptive hybrid*
- Real [progressThreshold](#)  
*when the progress metric falls below this threshold, the sequential adaptive hybrid switches to the next method*
- PRP2DArray [prpResults](#)

*2-D array of results corresponding to numIteratorJobs, one set of results per job (iterators may return multiple final solutions)*

- VariablesArray [parameterSets](#)

*1-D array of variable starting points for the iterator jobs*

### 43.119.1 Detailed Description

[Strategy](#) for sequential hybrid minimization using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity. The sequential hybrid minimization strategy has two approaches: (1) the non-adaptive sequential hybrid runs one method to completion, passes its best results as the starting point for a subsequent method, and continues this succession until all methods have been executed (the stopping rules are controlled internally by each minimizer), and (2) the adaptive sequential hybrid uses adaptive stopping rules for the minimizers that are controlled externally by the strategy. Note that while the strategy is targeted at minimizers, any iterator may be used so long as it defines the notion of a final solution which can be passed as the starting point for subsequent iterators.

### 43.119.2 Member Function Documentation

#### 43.119.2.1 void pack\_parameters\_buffer (MPIPackBuffer & *send\_buffer*, int *job\_index*) [inline, protected, virtual]

pack a send\_buffer for assigning an iterator job to a server This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.

Reimplemented from [Strategy](#).

References SequentialHybridStrategy::extract\_parameter\_sets(), and SequentialHybridStrategy::seqCount.

Referenced by SequentialHybridStrategy::run\_sequential().

#### 43.119.2.2 void unpack\_parameters\_buffer (MPIUnpackBuffer & *recv\_buffer*) [inline, protected, virtual]

unpack a recv\_buffer for accepting an iterator job from the scheduler This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.

Reimplemented from [Strategy](#).

References SequentialHybridStrategy::initialize\_iterator(), and SequentialHybridStrategy::seqCount.

#### 43.119.2.3 void pack\_results\_buffer (MPIPackBuffer & *send\_buffer*, int *job\_index*) [inline, protected, virtual]

pack a send\_buffer for returning iterator results from a server This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.

Reimplemented from [Strategy](#).

References SequentialHybridStrategy::prpResults.

#### **43.119.2.4 void unpack\_results\_buffer (MPIUnpackBuffer & *recv\_buffer*, int *job\_index*) [inline, protected, virtual]**

unpack a recv\_buffer for accepting iterator results from a server This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).

Reimplemented from [Strategy](#).

References SequentialHybridStrategy::prpResults.

#### **43.119.2.5 void run\_sequential () [private]**

run a sequential hybrid In the sequential nonadaptive case, there is no interference with the iterators. Each runs until its own convergence criteria is satisfied. Status: fully operational.

References Iterator::accepts\_multiple\_points(), ParallelLibrary::bcast\_i(), ParallelLibrary::bcast\_si(), Response::function\_values(), Strategy::graph2DFlag, Iterator::initialize\_graphics(), Model::interface\_id(), Response::is\_null(), Variables::is\_null(), Strategy::iteratorCommRank, Strategy::iteratorCommSize, Strategy::iteratorServerId, HybridStrategy::methodList, Iterator::num\_final\_solutions(), Strategy::numIteratorJobs, HybridStrategy::numIterators, Strategy::numIteratorServers, SequentialHybridStrategy::pack\_parameters\_buffer(), Strategy::parallelLib, SequentialHybridStrategy::parameterSets, Strategy::paramsMsgLen, SequentialHybridStrategy::prpResults, ParallelLibrary::recv\_si(), Iterator::response\_results(), Strategy::resultsMsgLen, Iterator::returns\_multiple\_points(), Strategy::schedule\_iterators(), HybridStrategy::selectedIterators, ParallelLibrary::send\_si(), SequentialHybridStrategy::seqCount, MPIPackBuffer::size(), Strategy::stratIterDedMaster, Strategy::stratIterMessagePass, Strategy::tabularDataFile, Strategy::tabularDataFlag, HybridStrategy::userDefinedModels, Iterator::variables\_results(), Strategy::worldRank, and Dakota::write\_data().

Referenced by SequentialHybridStrategy::run\_strategy().

#### **43.119.2.6 void run\_sequential\_adaptive () [private]**

run a sequential adaptive hybrid In the sequential adaptive case, there is interference with the iterators through the use of the ++ overloaded operator. iterator++ runs the iterator for one cycle, after which a progress\_metric is computed. This progress metric is used to dictate method switching instead of each iterator's internal convergence criteria. Status: incomplete.

References Strategy::graph2DFlag, HybridStrategy::methodList, HybridStrategy::numIterators, SequentialHybridStrategy::progressMetric, SequentialHybridStrategy::progressThreshold, Strategy::run\_iterator(), HybridStrategy::selectedIterators, SequentialHybridStrategy::seqCount, Strategy::tabularDataFile, Strategy::tabularDataFlag, HybridStrategy::userDefinedModels, and Strategy::worldRank.

Referenced by SequentialHybridStrategy::run\_strategy().

**43.119.2.7 void extract\_parameter\_sets (int job\_index, VariablesArray & partial\_param\_sets)  
[**inline**, **private**]**

extract partial\_param\_sets from parameterSets based on job\_index This convenience function is executed on an iterator master (static scheduling) or a strategy master (self scheduling) at run initialization time and has access to the full parameterSets array (this is All-Reduced for all peers at the completion of each cycle in [run\\_sequential\(\)](#)).

References SequentialHybridStrategy::parameterSets, and SequentialHybridStrategy::partition\_sets().

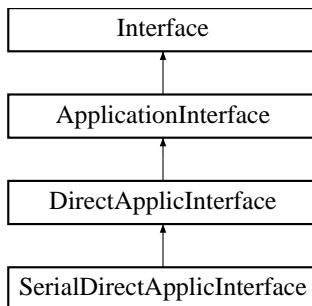

Referenced by SequentialHybridStrategy::initialize\_iterator(), and SequentialHybridStrategy::pack\_parameters\_buffer().

## 43.120 SerialDirectApplicInterface Class Reference

Sample derived interface class for testing serial simulator plug-ins using [assign\\_rep\(\)](#). Inheritance diagram for SerialDirectApplicInterface::

### Public Member Functions

- [SerialDirectApplicInterface](#) (const [Dakota::ProblemDescDB](#) &problem\_db)  
*constructor*
- [~SerialDirectApplicInterface](#) ()  
*destructor*

### Protected Member Functions

- [int derived\\_map\\_ac](#) (const [Dakota::String](#) &ac\_name)  
*execute an analysis code portion of a direct evaluation invocation*

### 43.120.1 Detailed Description

Sample derived interface class for testing serial simulator plug-ins using [assign\\_rep\(\)](#). The plug-in [SerialDirectApplicInterface](#) resides in namespace [SIM](#) and uses a copy of [rosenbrock\(\)](#) to perform serial parameter to response mappings. It may be activated by specifying the --with-plugin configure option, which activates the DAKOTA\_PLUGIN macro in dakota\_config.h used by [main.C](#) (which activates the plug-in code block within that file) and activates the PLUGIN\_S declaration defined in Makefile.include and used in Makefile.source (which add this class to the build). Test input files should then use an analysis\_driver of "plugin\_rosenbrock".

The documentation for this class was generated from the following files:

- [PluginSerialDirectApplicInterface.H](#)
- [PluginSerialDirectApplicInterface.C](#)

## 43.121 SharedVariablesData Class Reference

Container class encapsulating variables data that can be shared among a set of [Variables](#) instances.

### Public Member Functions

## Private Attributes

- `SharedVariablesDataRep * svdRep`  
*pointer to the body (handle-body idiom)*

### 43.121.1 Detailed Description

Container class encapsulating variables data that can be shared among a set of [Variables](#) instances. An array of [Variables](#) objects (e.g., [Analyzer::allVariables](#)) contains repeated configuration data (id's, labels, counts). [SharedVariablesData](#) employs a handle-body idiom to allow this shared data to be managed in a single object with many references to it, one per [Variables](#) object in the array. This allows scaling to larger sample sets.

The documentation for this class was generated from the following file:

- SharedVariablesData.H

## 43.122 SharedVariablesDataRep Class Reference

The representation of a [SharedVariablesData](#) instance. This representation, or body, may be shared by multiple [SharedVariablesData](#) handle instances.

### Private Member Functions

## Friends

- class **SharedVariablesData**

### 43.122.1 Detailed Description

The representation of a `SharedVariablesData` instance. This representation, or body, may be shared by multiple `SharedVariablesData` handle instances. The `SharedVariablesData/SharedVariablesDataRep` pairs utilize a handle-body idiom (Coplien, Advanced C++).

### 43.122.2 Constructor & Destructor Documentation

#### 43.122.2.1 `SharedVariablesDataRep (const ProblemDescDB & problem_db, const std::pair< short, short > & view) [private]`

standard constructor This constructor is the one which must build the base class data for all derived classes. `get_variables()` instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling `get_variables()` again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in `~Variables`).

References `SharedVariablesDataRep::allContinuousLabels`, `SharedVariablesDataRep::allDiscreteIntLabels`, `SharedVariablesDataRep::allDiscreteRealLabels`, `Dakota::copy_data_partial()`, `ProblemDescDB::get_dsa()`, `ProblemDescDB::get_sizet()`, `SharedVariablesDataRep::initialize_all_continuous_ids()`, `SharedVariablesDataRep::initialize_all_continuous_types()`, `SharedVariablesDataRep::initialize_all_discrete_int_types()`, `SharedVariablesDataRep::initialize_all_discrete_real_types()`, `SharedVariablesDataRep::variablesComponents`, `SharedVariablesDataRep::variablesCompsTotals`, and `SharedVariablesDataRep::variablesView`.

### 43.122.3 Member Data Documentation

#### 43.122.3.1 `SizetMultiArray allContinuousIds [private]`

array of 1-based position identifiers for the all continuous variables array These identifiers define positions of the all continuous variables array within the total variable sequence.

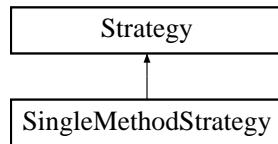

Referenced by `SharedVariablesDataRep::initialize_all_continuous_ids()`.

The documentation for this class was generated from the following files:

- `SharedVariablesData.H`
- `SharedVariablesData.C`

## 43.123 SingleMethodStrategy Class Reference

Simple fall-through strategy for running a single iterator on a single model. Inheritance diagram for SingleMethodStrategy::

### Public Member Functions

*return the final solution from selectedIterator (response)*

### Private Attributes

- [`Model userDefinedModel`](#)  
*the model to be iterated*
- [`Iterator selectedIterator`](#)  
*the iterator*

### 43.123.1 Detailed Description

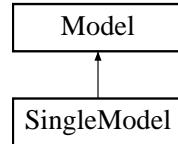

Simple fall-through strategy for running a single iterator on a single model. This strategy executes a single iterator on a single model. Since it does not provide coordination for multiple iterators and models, it can be considered to be a "fall-through" strategy in that it allows control to fall through immediately to the iterator.

The documentation for this class was generated from the following files:

- SingleMethodStrategy.H
- SingleMethodStrategy.C

## 43.124 SingleModel Class Reference

Derived model class which utilizes a single interface to map variables into responses. Inheritance diagram for SingleModel::

### 43.126.1 Detailed Description

Wrapper class for the OPT++ optimization library. The [SNLLLeastSq](#) class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia's Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, `max_step`, `gradient_tolerance`, `search_method`, and `search_scheme_size` are set using OPT++'s `setMaxIter()`, `setMaxFeval()`, `setFcnTol()`, `setMaxStep()`, `setGradTol()`, `setSearchStrategy()`, and `setSSS()` member functions, respectively; `output` verbosity is used to toggle OPT++'s debug mode using the `setDebug()` member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA `search_method` specification supports 4 (`value_based_line_search`, `gradient_based_line_search`, `trust_region`, or `tr_pds`). The difference stems from the "is\_expensive" flag in OPT++. If the search strategy is LineSearch and "is\_expensive" is turned on, then the `value_based_line_search` is used. Otherwise (the "is\_expensive" default is off), the algorithm will use the `gradient_based_line_search`. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions.

### 43.126.2 Member Function Documentation

#### 43.126.2.1 void post\_run (std::ostream & s) [protected, virtual]

invokes `snll_post_run` and re-implements `post_run` (does not call parent) and performs other solution processing. [SNLLLeastSq](#) requires fn DB lookup, so overrides [LeastSq::post\\_run](#) and directly invokes [Iterator::post\\_run](#) when complete.

Reimplemented from [LeastSq](#).

References `Iterator::activeSet`, `Iterator::bestResponseArray`, `Iterator::bestVariablesArray`, `SNLLBase::copy_con_vals_optpp_to_dak()`, `Dakota::copy_data_partial()`, `Minimizer::cvScaleMultipliers`, `Minimizer::cvScaleOffsets`, `Minimizer::cvScaleTypes`, `Dakota::data_pairs`, `Response::function_values()`, `LeastSq::get_confidence_intervals()`, `Model::interface_id()`, `Iterator::iteratedModel`, `Dakota::lookup_by_val()`, `Minimizer::modify_s2n()`, `SNLLLeastSq::nlfObjective`, `Iterator::numFunctions`, `LeastSq::numLeastSqTerms`, `Minimizer::numNonlinearConstraints`, `ActiveSet::request_values()`, `ActiveSet::request_vector()`, `Minimizer::responseScaleMultipliers`, `Minimizer::responseScaleOffsets`, `Minimizer::responseScaleTypes`, `Minimizer::secondaryRespScaleFlag`, `SNLLBase::snll_post_run()`, `SNLLLeastSq::theOptimizer`, and `Minimizer::varsScaleFlag`.

**43.126.2.2 void nlf2\_evaluator\_gn (int mode, int n, const RealVector & x, double & f, RealVector & grad\_f, RealSymMatrix & hess\_f, int & result\_mode) [static, private]**

objective function evaluator function which obtains values and gradients for least square terms and computes objective function value, gradient, and Hessian using the Gauss-Newton approximation. This nlf2 evaluator function is used for the Gauss-Newton method in order to exploit the special structure of the nonlinear least squares problem. Here,  $fx = \sum (T_i - Tbar_i)^2$  and [Response](#) is made up of residual functions and their gradients along with any nonlinear constraints. The objective function and its gradient vector and Hessian matrix are computed directly from the residual functions and their derivatives (which are returned from the [Response](#) object).

References Dakota::abort\_handler(), Iterator::activeSet, Model::compute\_response(), Model::continuous\_variables(), Model::current\_response(), Response::function\_gradients(), Response::function\_values(), Iterator::iteratedModel, SNLLBase::lastEvalMode, SNLLBase::lastEvalVars, SNLLBase::lastFnEvalLocn, Iterator::numFunctions, LeastSq::numLeastSqTerms, Minimizer::numNonlinearConstraints, Iterator::outputLevel, ActiveSet::request\_vector(), SNLLLeastSq::snllLSqInstance, Dakota::write\_data(), and Dakota::write\_precision.

### 43.127.1 Detailed Description

Wrapper class for the OPT++ optimization library. The [SNLOptimizer](#) class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia's Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, `max_step`, `gradient_tolerance`, `search_method`, and `search_scheme_size` are set using OPT++'s `setMaxIter()`, `setMaxFeval()`, `setFcnTol()`, `setMaxStep()`, `setGradTol()`, `setSearchStrategy()`, and `setSSS()` member functions, respectively; `output` verbosity is used to toggle OPT++'s

debug mode using the `setDebug()` member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA `search_method` specification supports 4 (`value_based_line_search`, `gradient_based_line_search`, `trust_region`, or `tr_pds`). The difference stems from the "is\_expensive" flag in OPT++. If the search strategy is `LineSearch` and "is\_expensive" is turned on, then the `value_based_line_search` is used. Otherwise (the "is\_expensive" default is off), the algorithm will use the `gradient_based_line_search`. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions.

## 43.127.2 Constructor & Destructor Documentation

### 43.127.2.1 SNLLOptimizer (Model & *model*)

standard constructor This constructor is used for normal instantiations using data from the [ProblemDescDB](#).

References Dakota::abort\_handler(), Minimizer::boundConstraintFlag, SNLLOptimizer::constraint0\_evaluator(), SNLLOptimizer::constraint1\_evaluator(), SNLLOptimizer::constraint2\_evaluator(), Iterator::convergenceTol, Iterator::fdGradStepSize, SNLLOptimizer::fdnlf1, SNLLOptimizer::fdnlf1Con, ProblemDescDB::get\_int(), ProblemDescDB::get\_real(), ProblemDescDB::get\_string(), Model::init\_communicators(), SNLLBase::init\_fn(), Iterator::intervalType, Iterator::iteratedModel, Dakota::LARGE\_SCALE, Optimizer::localObjectiveRecast, Iterator::maxConcurrency, Iterator::maxFunctionEvals, Iterator::maxIterations, SNLLBase::meritFn, Iterator::methodName, SNLLOptimizer::nlf0, SNLLOptimizer::nlf0\_evaluator(), SNLLOptimizer::nlf1, SNLLOptimizer::nlf1\_evaluator(), SNLLOptimizer::nlf1Con, SNLLOptimizer::nlf2, SNLLOptimizer::nlf2\_evaluator(), SNLLOptimizer::nlf2Con, SNLLOptimizer::nlfConstraint, SNLLOptimizer::nlfObjective, SNLLOptimizer::nlpConstraint, Minimizer::numConstraints, Iterator::numContinuousVars, Minimizer::numNonlinearConstraints, SNLLOptimizer::optbcfdnewton, SNLLOptimizer::optbcnewton, SNLLOptimizer::optbcqnewton, SNLLOptimizer::optcg, SNLLOptimizer::optfdnewton, SNLLOptimizer::optfdnips, SNLLOptimizer::optlbfgs, SNLLOptimizer::optnewton, SNLLOptimizer::optnips, SNLLOptimizer::optpds, SNLLOptimizer::optqnewton, SNLLOptimizer::optqnips, Iterator::outputLevel, Iterator::probDescDB, Minimizer::scaleFlag, SNLLBase::searchStrat, SNLLBase::snll\_post\_instantiate(), SNLLBase::snll\_pre\_instantiate(), SNLLOptimizer::theOptimizer, and Minimizer::vendorNumericalGradFlag.

### 43.127.2.2 SNLLOptimizer (const String & *method\_name*, Model & *model*)

alternate constructor for instantiations "on the fly" This is an alternate constructor for instantiations on the fly using a [Model](#) but no [ProblemDescDB](#).

References Minimizer::boundConstraintFlag, SNLLOptimizer::constraint1\_evaluator(), Iterator::convergenceTol, Iterator::fdGradStepSize, SNLLBase::init\_fn(), Iterator::intervalType, Dakota::LARGE\_SCALE, Iterator::maxFunctionEvals, Iterator::maxIterations, SNLLBase::meritFn, Iterator::methodName, SNLLOptimizer::nlf1, SNLLOptimizer::nlf1\_evaluator(), SNLLOptimizer::nlf1Con, SNLLOptimizer::nlfConstraint, SNLLOptimizer::nlfObjective, SNLLOptimizer::nlpConstraint, Minimizer::numConstraints, Iterator::numContinuousVars, Minimizer::numNonlinearConstraints, SNLLOptimizer::optbcqnewton, SNLLOptimizer::optlbfgs, SNLLOptimizer::optqnewton, SNLLOptimizer::optqnips, Iterator::outputLevel, SNLLBase::searchStrat, SNLLBase::snll\_post\_instantiate(), SNLLBase::snll\_pre\_instantiate(), SNLLOptimizer::theOptimizer, and Minimizer::vendorNumericalGradFlag.

---

**43.127.2.3 SNLOptimizer (const RealVector & *initial\_pt*, const RealVector & *var\_l\_bnds*, const RealVector & *var\_u\_bnds*, const RealMatrix & *lin\_ineq\_coeffs*, const RealVector & *lin\_ineq\_l\_bnds*, const RealVector & *lin\_ineq\_u\_bnds*, const RealMatrix & *lin\_eq\_coeffs*, const RealVector & *lin\_eq\_tgts*, const RealVector & *nln\_ineq\_l\_bnds*, const RealVector & *nln\_ineq\_u\_bnds*, const RealVector & *nln\_eq\_tgts*, void(\*)(int mode, int n, const RealVector &x, double &f, RealVector &grad\_f, int &result\_mode) *user\_obj\_eval*, void(\*)(int mode, int n, const RealVector &x, RealVector &g, RealMatrix &grad\_g, int &result\_mode) *user\_con\_eval*)**

alternate constructor for instantiations "on the fly" This is an alternate constructor for performing an optimization using the passed in objective function and constraint function pointers.

References Minimizer::bigRealBoundSize, Minimizer::boundConstraintFlag, SNLLBase::init\_fn(), SNLOptimizer::initialPoint, Dakota::LARGE\_SCALE, SNLOptimizer::lowerBounds, SNLLBase::meritFn, SNLOptimizer::nlf1, SNLOptimizer::nlf1Con, SNLOptimizer::nlfConstraint, SNLOptimizer::nlfObjective, SNLOptimizer::nlpConstraint, Minimizer::numConstraints, Iterator::numContinuousVars, Minimizer::numNonlinearConstraints, SNLOptimizer::optbcnewton, SNLOptimizer::optlbfgs, SNLOptimizer::optqnewton, SNLOptimizer::optqnips, Iterator::outputLevel, SNLLBase::searchStrat, SNLLBase::snll\_initialize\_run(), SNLLBase::snll\_post\_instantiate(), SNLLBase::snll\_pre\_instantiate(), SNLOptimizer::theOptimizer, and SNLOptimizer::upperBounds.

### 43.127.3 Member Function Documentation

**43.127.3.1 void nlf0\_evaluator (int *n*, const RealVector & *x*, double & *f*, int & *result\_mode*) [static, private]**

objective function evaluator function for OPT++ methods which require only function values. For use when DAKOTA computes f and gradients are not directly available. This is used by nongradient-based optimizers such as PDS and by gradient-based optimizers in vendor numerical gradient mode (opt++'s internal finite difference routine is used).

References Model::compute\_response(), Model::continuous\_variables(), Model::current\_response(), Response::function\_value(), Iterator::iteratedModel, SNLLBase::lastEvalVars, SNLLBase::lastFnEvalLocn, Minimizer::numNonlinearConstraints, Iterator::outputLevel, and SNLOptimizer::snllOptInstance.

Referenced by SNLOptimizer::SNLOptimizer().

**43.127.3.2 void nlf1\_evaluator (int *mode*, int *n*, const RealVector & *x*, double & *f*, RealVector & *grad\_f*, int & *result\_mode*) [static, private]**

objective function evaluator function which provides function values and gradients to OPT++ methods. For use when DAKOTA computes f and df/dX (regardless of gradientType). Vendor numerical gradient case is handled by nlf0\_evaluator.

References Iterator::activeSet, Model::compute\_response(), Model::continuous\_variables(), Model::current\_response(), Response::function\_gradient\_copy(), Response::function\_value(), Iterator::iteratedModel, SNLLBase::lastEvalMode, SNLLBase::lastEvalVars, SNLLBase::lastFnEvalLocn, Minimizer::numNonlinearConstraints, Iterator::outputLevel, ActiveSet::request\_values(), and SNLOptimizer::snllOptInstance.

Referenced by SNLOptimizer::SNLOptimizer().

---

**43.127.3.3 void nlf2\_evaluator (int *mode*, int *n*, const RealVector & *x*, double & *f*, RealVector & *grad\_f*, RealSymMatrix & *hess\_f*, int & *result\_mode*) [static, private]**

objective function evaluator function which provides function values, gradients, and Hessians to OPT++ methods. For use when DAKOTA receives *f*,  $df/dX$ , &  $d^2f/dx^2$  from the [ApplicationInterface](#) (analytic only). Finite differencing does not make sense for a full Newton approach, since lack of analytic gradients & Hessian should dictate the use of quasi-newton or fd-newton. Thus, there is no *fdnlf2\_evaluator* for use with full Newton approaches, since it is preferable to use quasi-newton or fd-newton with *nlf1*. Gauss-Newton does not fit this model; it uses *nlf2\_evaluator\_gn* instead of *nlf2\_evaluator*.

- int `referenceCount`  
*number of objects sharing strategyRep*

### 43.129.1 Detailed Description

Base class for the strategy class hierarchy. The `Strategy` class is the base class for the class hierarchy providing the top level control in DAKOTA. The strategy is responsible for creating and managing iterators and models. For memory efficiency and enhanced polymorphism, the strategy hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (`Strategy`) serves as the envelope and one of the derived classes (selected in `Strategy::get_strategy()`) serves as the letter.

## 43.129.2 Constructor & Destructor Documentation

### 43.129.2.1 Strategy ()

default constructor Default constructor. strategyRep is NULL in this case (a populated problem\_db is needed to build a meaningful [Strategy](#) object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

### 43.129.2.2 Strategy (ProblemDescDB & *problem\_db*)

envelope constructor Used in [main.C](#) instantiation to build the envelope. This constructor only needs to extract enough data to properly execute [get\\_strategy](#), since [Strategy::Strategy](#)(BaseConstructor, problem\_db) builds the actual base class data inherited by the derived strategies.

References Dakota::abort\_handler(), [Strategy::get\\_strategy\(\)](#), and [Strategy::strategyRep](#).

### 43.129.2.3 Strategy (const Strategy & *strat*)

copy constructor Copy constructor manages sharing of strategyRep and incrementing of referenceCount.

References [Strategy::referenceCount](#), and [Strategy::strategyRep](#).

### 43.129.2.4 ~Strategy () [virtual]

destructor Destructor decrements referenceCount and only deletes strategyRep when referenceCount reaches zero.

References ParallelLibrary::free\_iterator\_communicators(), ParallelLibrary::is\_null(), [Strategy::parallelLib](#), [Strategy::referenceCount](#), and [Strategy::strategyRep](#).

### 43.129.2.5 Strategy (BaseConstructor, ProblemDescDB & *problem\_db*) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all inherited strategies. [get\\_strategy\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_strategy\(\)](#) again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Strategy).

References ProblemDescDB::get\_int(), [Strategy::probDescDB](#), and Dakota::write\_precision.

## 43.129.3 Member Function Documentation

### 43.129.3.1 Strategy operator= (const Strategy & *strat*)

assignment operator Assignment operator decrements referenceCount for old strategyRep, assigns new strategyRep, and increments referenceCount for new strategyRep.

References [Strategy::referenceCount](#), and [Strategy::strategyRep](#).

**43.129.3.2 void pack\_parameters\_buffer (MPIPackBuffer & *send\_buffer*, int *job\_index*)  
[protected, virtual]**

pack a send\_buffer for assigning an iterator job to a server This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.

Reimplemented in [ConcurrentStrategy](#), and [SequentialHybridStrategy](#).

References Strategy::pack\_parameters\_buffer(), and Strategy::strategyRep.

Referenced by Strategy::pack\_parameters\_buffer(), and Strategy::self\_schedule\_iterators().

**43.129.3.3 void unpack\_parameters\_buffer (MPIUnpackBuffer & *recv\_buffer*) [protected,  
virtual]**

unpack a recv\_buffer for accepting an iterator job from the scheduler This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.

Reimplemented in [ConcurrentStrategy](#), and [SequentialHybridStrategy](#).

References Strategy::strategyRep, and Strategy::unpack\_parameters\_buffer().

Referenced by Strategy::serve\_iterators(), and Strategy::unpack\_parameters\_buffer().

**43.129.3.4 void pack\_results\_buffer (MPIPackBuffer & *send\_buffer*, int *job\_index*) [protected,  
virtual]**

pack a send\_buffer for returning iterator results from a server This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.

Reimplemented in [ConcurrentStrategy](#), and [SequentialHybridStrategy](#).

References Strategy::pack\_results\_buffer(), and Strategy::strategyRep.

Referenced by Strategy::pack\_results\_buffer(), Strategy::serve\_iterators(), and Strategy::static\_schedule\_iterators().

**43.129.3.5 void unpack\_results\_buffer (MPIUnpackBuffer & *recv\_buffer*, int *job\_index*)  
[protected, virtual]**

unpack a recv\_buffer for accepting iterator results from a server This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).

Reimplemented in [ConcurrentStrategy](#), and [SequentialHybridStrategy](#).

References Strategy::strategyRep, and Strategy::unpack\_results\_buffer().

Referenced by Strategy::self\_schedule\_iterators(), Strategy::static\_schedule\_iterators(), and Strategy::unpack\_results\_buffer().

**43.129.3.6 void init\_iterator\_parallelism () [protected]**

convenience function for initializing iterator communicators, setting parallel configuration attributes, and managing outputs and restart. This function is called from derived class constructors once maxConcurrency is defined but prior to instantiating Iterators and Models.

References ParallelLevel::dedicated\_master\_flag(), ProblemDescDB::get\_int(), ProblemDescDB::get\_string(), ParallelLibrary::init\_iterator\_communicators(), Strategy::iteratorCommRank, Strategy::iteratorCommSize, Strategy::iteratorServerId, ParallelLibrary::manage\_outputs\_restart(), Strategy::maxConcurrency, ParallelLevel::message\_pass(), ParallelLevel::num\_servers(), Strategy::numIteratorServers, Strategy::parallelILib, Strategy::probDescDB, ParallelLevel::server\_communicator\_rank(), ParallelLevel::server\_communicator\_size(), ParallelLevel::server\_id(), Strategy::stratIterDedMaster, and Strategy::stratIterMessagePass.

Referenced by CollaborativeHybridStrategy::CollaborativeHybridStrategy(), ConcurrentStrategy::ConcurrentStrategy(), EmbeddedHybridStrategy::EmbeddedHybridStrategy(), SequentialHybridStrategy::SequentialHybridStrategy(), and SingleMethodStrategy::SingleMethodStrategy().

**43.129.3.7 void init\_iterator (Iterator & the\_iterator, Model & the\_model) [protected]**

convenience function for allocating comms prior to running an iterator This is a convenience function for encapsulating the allocation of communicators prior to running an iterator. It does not require a strategyRep forward since it is only used by letter objects.

References ProblemDescDB::get\_iterator(), Model::init\_comms\_bcast\_flag(), Model::init\_communicators(), Strategy::iteratorCommRank, Strategy::iteratorCommSize, Iterator::maximum\_concurrency(), Strategy::probDescDB, Model::serve\_configurations(), and Model::stop\_configurations().

Referenced by HybridStrategy::allocate\_methods(), ConcurrentStrategy::ConcurrentStrategy(), and SingleMethodStrategy::SingleMethodStrategy().

**43.129.3.8 void run\_iterator (Iterator & the\_iterator, Model & the\_model) [protected]**

Convenience function for invoking an iterator and managing parallelism. This version omits communicator repartitioning. Function must be public due to use by MINLPNode. This is a convenience function for encapsulating the parallel features (run/serve) of running an iterator. This function omits allocation/deallocation of communicators to provide greater efficiency in those strategies which involve multiple iterator executions but only require communicator allocation/deallocation to be performed once.

It does not require a strategyRep forward since it is only used by letter objects. While it is currently a public function due to its use in MINLPNode, this usage still involves a strategy letter object.

References Strategy::iteratorCommRank, Iterator::maximum\_concurrency(), Iterator::run\_iterator(), Model::serve(), Model::set\_communicators(), and Model::stop\_servers().

Referenced by SequentialHybridStrategy::run\_sequential\_adaptive(), SingleMethodStrategy::run\_strategy(), Strategy::serve\_iterators(), and Strategy::static\_schedule\_iterators().

**43.129.3.9 void free\_iterator (Iterator & the\_iterator, Model & the\_model) [protected]**

convenience function for deallocating comms after running an iterator This is a convenience function for encapsulating the deallocation of communicators after running an iterator. It does not require a strategyRep forward

since it is only used by letter objects.

References Model::free\_communicators(), and Iterator::maximum\_concurrency().

Referenced by HybridStrategy::deallocate\_methods(), ConcurrentStrategy::~ConcurrentStrategy(), and SingleMethodStrategy::~SingleMethodStrategy().

#### **43.129.3.10 void schedule\_iterators (Iterator & the\_iterator, Model & the\_model) [protected]**

short convenience function for distributing control among [self\\_schedule\\_iterators\(\)](#), [serve\\_iterators\(\)](#), and [static\\_schedule\\_iterators\(\)](#). This implementation supports the scheduling of multiple jobs using a single iterator/model pair. Additional future (overloaded) implementations could involve independent iterator instances.

References Strategy::self\_schedule\_iterators(), Strategy::serve\_iterators(), Strategy::static\_schedule\_iterators(), Strategy::stratIterDedMaster, and Strategy::worldRank.

Referenced by SequentialHybridStrategy::run\_sequential(), EmbeddedHybridStrategy::run\_strategy(), ConcurrentStrategy::run\_strategy(), and CollaborativeHybridStrategy::run\_strategy().

#### **43.129.3.11 void self\_schedule\_iterators (Model & the\_model) [protected]**

executed by the strategy master to self-schedule iterator jobs among slave iterator servers (called by derived [run\\_strategy\(\)](#)). This function is adapted from [ApplicationInterface::self\\_schedule\\_evaluations\(\)](#).

References ParallelLibrary::free(), ParallelLibrary::irecv\_si(), ParallelLibrary::isend\_si(), Strategy::numIteratorJobs, Strategy::numIteratorServers, Strategy::pack\_parameters\_buffer(), Strategy::parallelLib, ParallelLibrary::print\_configuration(), MPIPackBuffer::reset(), MPIUnpackBuffer::resize(), Strategy::resultsMsgLen, Strategy::unpack\_results\_buffer(), ParallelLibrary::waitall(), and ParallelLibrary::watsome().

Referenced by Strategy::schedule\_iterators().

#### **43.129.3.12 void serve\_iterators (Iterator & the\_iterator, Model & the\_model) [protected]**

executed on the slave iterator servers to perform iterator jobs assigned by the strategy master (called by derived [run\\_strategy\(\)](#)). This function is similar in structure to [ApplicationInterface::serve\\_evaluations\\_synch\(\)](#).

References ParallelLibrary::bcast\_i(), Strategy::iteratorCommRank, Strategy::iteratorCommSize, Strategy::pack\_results\_buffer(), ParallelLibrary::parallel\_time(), Strategy::parallelLib, Strategy::paramsMsgLen, ParallelLibrary::recv\_si(), Strategy::resultsMsgLen, Strategy::run\_iterator(), ParallelLibrary::send\_si(), Strategy::unpack\_parameters\_buffer(), and Strategy::update\_local\_results().

Referenced by Strategy::schedule\_iterators().

#### **43.129.3.13 Strategy \* get\_strategy () [private]**

Used by the envelope to instantiate the correct letter class. Used only by the envelope constructor to initialize strategyRep to the appropriate derived type, as given by the strategyName attribute.

References String::begins(), ProblemDescDB::get\_string(), Strategy::probDescDB, and Strategy::strategyName.

Referenced by Strategy::Strategy().

*Returns pointer to standard C char array.*

### 43.130.1 Detailed Description

[Dakota::String](#) class, used as main string class for [Dakota](#). The [Dakota::String](#) class is the common string class for [Dakota](#). It provides a common interface for string operations whether using the std::string interface or the (legacy) RogueWave RWCString API

### 43.130.2 Member Function Documentation

#### 43.130.2.1 operator const char \* () const [inline]

The operator() returns pointer to standard C char array. The operator () returns a pointer to a char string. Uses the STL c\_str() method. This allows for the [String](#) to be used in method calls without having to call the [data\(\)](#) or [c\\_str\(\)](#) methods.

#### 43.130.2.2 void upper ()

Private method which converts [String](#) to upper. Utilizes an STL iterator to step through the string and then calls the STL toupper() method. Needs to be done this way because STL only provides a single char toupper method.

Referenced by Dakota::toUpper(), and String::toUpper().

#### 43.130.2.3 void lower ()

Private method which converts [String](#) to lower. Utilizes an STL iterator to step through the string and then calls the STL tolower() method. Needs to be done this way because STL only provides a single char tolower method.

Referenced by Dakota::toLower(), and String::toLower().

#### 43.130.2.4 bool contains (const char \* sub\_string) const [inline]

Returns true if [String](#) contains char\* substring. Returns true if the [String](#) contains the char\* sub\_string. Uses the STL find() method.

Referenced by Interface::algebraic\_function\_type().

#### 43.130.2.5 **bool begins (const char \* *sub\_string*) const [inline]**

Returns true if [String](#) starts with `char*` substring. Returns true if the [String](#) begins with the `char*` *sub\_string*. Uses the STL `compare()` method.

Referenced by `PecosApproximation::approx_type_to_basis_type()`, `DataFitSurrModel::approximation_coefficients()`, `DataFitSurrModel::build_local_multipoint()`, `ProblemDescDB::check_input()`, `DataFitSurrModel::DataFitSurrModel()`, `SurrogateModel::force_rebuild()`, `ProblemDescDB::get_dis()`, `ProblemDescDB::get_ds2a()`, `Iterator::get_iterator()`, `ProblemDescDB::get_real()`, `ProblemDescDB::get_rsdm()`, `Strategy::get_strategy()`, `ProblemDescDB::get_string()`, `ProblemDescDB::get_ushort()`, `Variables::get_view()`, `NLPQLPOptimizer::initialize()`, `NCSUOptimizer::initialize()`, `DOTOptimizer::initialize()`, `CONMINOptimizer::initialize()`, `SurrBasedMinimizer::initialize_graphics()`, `Minimizer::Minimizer()`, `Optimizer::Optimizer()`, `ParamStudy::ParamStudy()`, `SurrBasedMinimizer::print_results()`, `ProblemDescDB::set()`, and `SurrBasedLocalMinimizer::SurrBasedLocalMinimizer()`.

#### 43.130.2.6 **bool ends (const char \* *sub\_string*) const [inline]**

Returns true if [String](#) ends with `char*` substring. Returns true if the [String](#) ends with the `char*` *sub\_string*. Uses the STL `compare()` method.

Referenced by `PecosApproximation::approx_type_to_basis_type()`, `ProblemDescDB::check_input()`, `DataFitSurrModel::DataFitSurrModel()`, `Approximation::get_approx()`, `Iterator::get_iterator()`, `ProblemDescDB::get_ushort()`, `Variables::get_view()`, `Interface::Interface()`, `Minimizer::Minimizer()`, `NonDLocalInterval::NonDLocalInterval()`, `NonDLocalReliability::NonDLocalReliability()`, `PStudyDACE::PStudyDACE()`, `SequentialHybridStrategy::run_strategy()`, `SequentialHybridStrategy::SequentialHybridStrategy()`, and `SOLBase::SOLBase()`.

#### 43.130.2.7 **char \* data () const [inline]**

Returns pointer to standard C `char` array. Returns a pointer to C style `char` array. Needed to mimic the Rogue Wave string class. USE WITH CARE.

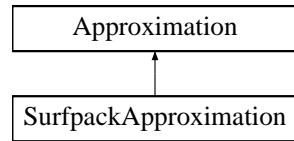

Referenced by `GridApplicInterface::derived_map_asynch()`, `GridApplicInterface::grid_file_test()`, `Interface::Interface()`, `Dakota::print_restart_tabular()`, and `ConcurrentStrategy::print_results()`.

### 43.131.1 Detailed Description

Derived approximation class for Surfpack approximation classes. [Interface](#) between Surfpack and [Dakota](#). The [SurfpackApproximation](#) class is the interface between [Dakota](#) and Surfpack. Based on the information in the [ProblemDescDB](#) that is passed in through the constructor, [SurfpackApproximation](#) builds a Surfpack Surface object that corresponds to one of the following data-fitting techniques: polynomial regression, kriging, artificial neural networks, radial basis function network, or multivariate adaptaitve regression splines (MARS).

### 43.131.2 Constructor & Destructor Documentation

#### 43.131.2.1 `SurfpackApproximation (const String & approx_type, const UShortArray & approx_order, size_t num_vars, short data_order)`

alternate constructor On-the-fly constructor which uses mostly Surfpack model defaults.

References Dakota::abort\_handler(), Approximation::approxLowerBounds, SurfpackApproximation::approxOrder, Approximation::approxType, Approximation::approxUpperBounds, Approximation::buildDataOrder, Dakota::copy\_data(), and SurfpackApproximation::factory.

### 43.131.3 Member Function Documentation

#### 43.131.3.1 `void build () [protected, virtual]`

SurfData object will be created from Dakota's SurrogateData, and the appropriate Surfpack build method will be invoked.

surfData will be deleted in dtor

#### **Todo**

Right now, we're completely deleting the old data and then recopying the current data into a SurfData object. This was just the easiest way to arrive at a solution that would build and run. This function is frequently called from addPoint rebuild, however, and it's not good to go through this whole process every time one more data point is added.

Reimplemented from [Approximation](#).

References Dakota::abort\_handler(), Approximation::approxLowerBounds, Approximation::approxUpperBounds, Dakota::copy\_data(), SurfpackApproximation::factory, SurfpackApproximation::model, Approximation::outputLevel, SurfpackApproximation::surfData, and SurfpackApproximation::surrogates\_to\_surf\_data().

#### 43.131.3.2 `const RealSymMatrix & get_hessian (const RealVector & x) [protected, virtual]`

retrieve the approximate function Hessian for a given parameter vector x

#### **Todo**

Make this acceptably efficient

Reimplemented from [Approximation](#).

References Dakota::abort\_handler(), Approximation::approxHessian, Approximation::approxType, Dakota::copy\_data(), and SurfpackApproximation::model.

#### 43.131.3.3 SurfData \* surrogates\_to\_surf\_data () [private]

copy from SurrogateData to SurfPoint/SurfData Copy the data stored in Dakota-style SurrogateData into Surfpack-style SurfPoint and SurfData objects.

References SurfpackApproximation::add\_anchor\_to\_surfdata(), SurfpackApproximation::add\_sdp\_to\_-surfdata(), Approximation::approxData, Approximation::buildDataOrder, SurfpackApproximation::factory, and Approximation::outputLevel.

Referenced by SurfpackApproximation::build().

#### 43.131.3.4 void add\_anchor\_to\_surfdata (SurfData & surf\_data) [private]

set the anchor point (including gradient and hessian if present) into surf\_data If there is an anchor point, add an equality constraint for its response value. Also add constraints for gradient and hessian, if applicable.

#### Todo

improve efficiency of conversion

References Dakota::abort\_handler(), Approximation::approxData, Dakota::copy\_data(), Approximation::outputLevel, and Dakota::write\_data().

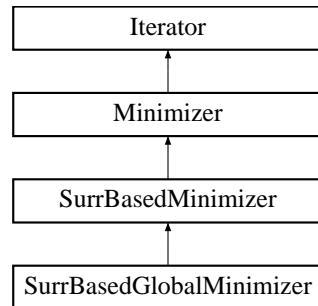

Referenced by SurfpackApproximation::surrogates\_to\_surf\_data().

### Private Attributes

- [bool replacePoints](#)  
*flag for replacing the previous iteration's point additions, rather than continuing to append, during construction of the next surrogate*

### 43.132.1 Detailed Description

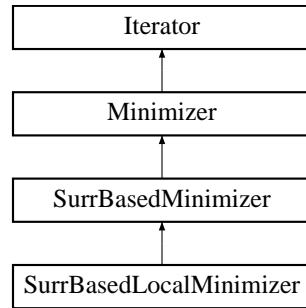

The global surrogate-based minimizer which sequentially minimizes and updates a global surrogate model without trust region controls. This method uses a [SurrogateModel](#) to perform minimization (optimization or nonlinear least squares) through a set of iterations. At each iteration, a surrogate is built, the surrogate is minimized, and the optimal points from the surrogate are then evaluated with the "true" function, to generate new points upon which the surrogate for the next iteration is built.

The documentation for this class was generated from the following files:

- SurrBasedGlobalMinimizer.H
- SurrBasedGlobalMinimizer.C

## 43.133 SurrBasedLocalMinimizer Class Reference

Class for provably-convergent local surrogate-based optimization and nonlinear least squares. Inheritance diagram for SurrBasedLocalMinimizer::

### 43.133.1 Detailed Description

Class for provably-convergent local surrogate-based optimization and nonlinear least squares. This minimizer uses a [SurrogateModel](#) to perform minimization based on local, global, or hierarchical surrogates. It achieves provable convergence through the use of a sequence of trust regions and the application of surrogate corrections at the trust region centers.

### 43.133.2 Member Function Documentation

#### 43.133.2.1 void minimize\_surrogates () [private, virtual]

Performs local surrogate-based minimization by minimizing local, global, or hierarchical surrogates over a series of trust regions. Trust region-based strategy to perform surrogate-based optimization in subregions (trust regions) of the parameter space. The minimizer operates on approximations in lieu of the more expensive simulation-based response functions. The size of the trust region is varied according to the goodness of the agreement between the approximations and the true response functions.

Implements [SurrBasedMinimizer](#).

#### 43.133.2.2 void hard\_convergence\_check (const Response & response\_truth, const RealVector & c\_vars, const RealVector & lower\_bnds, const RealVector & upper\_bnds) [private]

check for hard convergence (norm of projected gradient of merit function near zero) The hard convergence check computes the gradient of the merit function at the trust region center, performs a projection for active bound constraints (removing any gradient component directed into an active bound), and signals convergence if the 2-norm of this projected gradient is less than convergenceTol.

References SurrBasedLocalMinimizer::acceptLogic, SurrBasedLocalMinimizer::approxSubProbObj, SurrBasedMinimizer::constraint\_violation(), Minimizer::constraintTol, SurrBasedLocalMinimizer::convergenceFlag, Iterator::convergenceTol, Response::function\_gradients(), Response::function\_values(), Iterator::iteratedModel, SurrBasedMinimizer::lagrangian\_gradient(), SurrBasedLocalMinimizer::meritFnType, Iterator::numContinuousVars, Minimizer::numNonlinearConstraints, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, Model::primary\_response\_fn\_weights(), SurrBasedMinimizer::sbIterNum, SurrBasedLocalMinimizer::truthGradientFlag, SurrBasedMinimizer::update\_augmented\_lagrange\_multipliers(), SurrBasedMinimizer::update\_filter(), and SurrBasedMinimizer::update\_lagrange\_multipliers().

#### **43.133.2.3 void tr\_ratio\_check (const RealVector & c\_vars\_star, const RealVector & tr\_lower\_bnds, const RealVector & tr\_upper\_bnds) [private]**

compute trust region ratio (for SBLM iterate acceptance and trust region resizing) and check for soft convergence (diminishing returns) Assess acceptance of SBLM iterate (trust region ratio or filter) and compute soft convergence metrics (number of consecutive failures, min trust region size, etc.) to assess whether the convergence rate has decreased to a point where the process should be terminated (diminishing returns).

References SurrBasedLocalMinimizer::acceptLogic, SurrBasedLocalMinimizer::approxSubProbObj, SurrBasedMinimizer::augmented\_lagrangian\_merit(), SurrBasedMinimizer::constraint\_violation(), Minimizer::constraintTol, Iterator::convergenceTol, SurrBasedMinimizer::etaSequence, Response::function\_values(), SurrBasedLocalMinimizer::gammaContract, SurrBasedLocalMinimizer::gammaExpand, SurrBasedLocalMinimizer::globalApproxFlag, Iterator::iteratedModel, SurrBasedMinimizer::lagrangian\_merit(), SurrBasedLocalMinimizer::meritFnType, SurrBasedLocalMinimizer::newCenterFlag, Iterator::numContinuousVars, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, SurrBasedMinimizer::penalty\_merit(), Model::primary\_response\_fn\_weights(), SurrBasedLocalMinimizer::responseCenterApprox, SurrBasedLocalMinimizer::responseCenterTruth, SurrBasedLocalMinimizer::responseStarApprox, SurrBasedLocalMinimizer::responseStarTruth, SurrBasedLocalMinimizer::softConvCount, SurrBasedLocalMinimizer::trRatioContractValue, SurrBasedLocalMinimizer::trRatioExpandValue, SurrBasedLocalMinimizer::trustRegionFactor, SurrBasedMinimizer::update\_augmented\_lagrange\_multipliers(), SurrBasedMinimizer::update\_filter(), and SurrBasedLocalMinimizer::update\_penalty().

Referenced by SurrBasedLocalMinimizer::minimize\_surrogates().

#### **43.133.2.4 void update\_penalty (const RealVector & fns\_center\_truth, const RealVector & fns\_star\_truth) [private]**

initialize and update the penaltyParameter Scaling of the penalty value is important to avoid rejecting SBLM iterates which must increase the objective to achieve a reduction in constraint violation. In the basic penalty case, the penalty is ramped exponentially based on the iteration counter. In the adaptive case, the ratio of relative change between center and star points for the objective and constraint violation values is used to rescale penalty values.

### 43.134.1 Detailed Description

Base class for local/global surrogate-based optimization/least squares. These minimizers use a [SurrogateModel](#) to perform optimization based either on local trust region methods or global updating methods.

### 43.134.2 Member Function Documentation

#### 43.134.2.1 void run () [[inline](#), [protected](#), [virtual](#)]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References SurrBasedMinimizer::minimize\_surrogates().

#### 43.134.2.2 void print\_results (std::ostream & s) [[protected](#), [virtual](#)]

Redefines default iterator results printing to include optimization results (objective functions and constraints).

Reimplemented from [Iterator](#).

References Dakota::abort\_handler(), Iterator::activeSet, String::begins(), Iterator::bestResponseArray, Iterator::bestVariablesArray, Dakota::data\_pairs, Model::interface\_id(), Iterator::iteratedModel, Dakota::lookup\_by\_val(), Iterator::methodName, Iterator::numFunctions, Minimizer::numUserPrimaryFns, Minimizer::optimizationFlag, ActiveSet::request\_values(), Model::truth\_model(), and Dakota::write\_data\_partial().

#### **43.134.2.3 void update\_lagrange\_multipliers (const RealVector &fn\_vals, const RealMatrix &fn\_grads) [protected]**

initialize and update Lagrange multipliers for basic Lagrangian For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of a nonnegative linear least squares problem.

References Dakota::abort\_handler(), Minimizer::bigRealBoundSize, Minimizer::constraintTol, Iterator::iteratedModel, SurrBasedMinimizer::lagrangeMult, Iterator::numContinuousVars, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, Minimizer::objective\_gradient(), SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, and Model::primary\_response\_fn\_weights().

Referenced by SurrBasedLocalMinimizer::hard\_convergence\_check().

#### **43.134.2.4 void update\_augmented\_lagrange\_multipliers (const RealVector &fn\_vals) [protected]**

initialize and update the Lagrange multipliers for augmented Lagrangian For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of a nonnegative linear least squares problem.

References SurrBasedMinimizer::augLagrangeMult, SurrBasedMinimizer::betaEta, Minimizer::bigRealBoundSize, SurrBasedMinimizer::etaSequence, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, and SurrBasedMinimizer::penaltyParameter.

Referenced by SurrBasedLocalMinimizer::hard\_convergence\_check(), EffGlobalMinimizer::minimize\_surrogates\_on\_model(), and SurrBasedLocalMinimizer::tr\_ratio\_check().

#### **43.134.2.5 bool update\_filter (const RealVector &fn\_vals) [protected]**

update a filter from a set of function values Update the sbFilter with fn\_vals if new iterate is non-dominated.

References SurrBasedMinimizer::constraintViolation(), Iterator::iteratedModel, Minimizer::numNonlinearConstraints, Minimizer::objective(), Model::primary\_response\_fn\_weights(), and SurrBasedMinimizer::sbFilter.

Referenced by SurrBasedLocalMinimizer::hard\_convergence\_check(), and SurrBasedLocalMinimizer::tr\_ratio\_check().

**43.134.2.6 Real lagrangian\_merit (const RealVector & *fn\_vals*, const RealVector & *primary\_wts*, const RealVector & *nln\_ineq\_l\_bnds*, const RealVector & *nln\_ineq\_u\_bnds*, const RealVector & *nln\_eq\_tgts*) [protected]**

compute a Lagrangian function from a set of function values The Lagrangian function computation sums the objective function and the Lagrange multiplier terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with  $g \leq 0$  and  $h=0$ . The bounds/targets passed in may reflect the original constraints or the relaxed constraints.

References Minimizer::bigRealBoundSize, Minimizer::constraintTol, SurrBasedMinimizer::lagrangeMult, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, and Minimizer::objective().

Referenced by SurrBasedLocalMinimizer::approx\_subprob\_objective\_eval(), and SurrBasedLocalMinimizer::tr\_ratio\_check().

**43.134.2.7 Real augmented\_lagrangian\_merit (const RealVector & *fn\_vals*, const RealVector & *primary\_wts*, const RealVector & *nln\_ineq\_l\_bnds*, const RealVector & *nln\_ineq\_u\_bnds*, const RealVector & *nln\_eq\_tgts*) [protected]**

compute an augmented Lagrangian function from a set of function values The Rockafellar augmented Lagrangian function sums the objective function, Lagrange multiplier terms for inequality/equality constraints, and quadratic penalty terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with  $g \leq 0$  and  $h=0$ . The bounds/targets passed in may reflect the original constraints or the relaxed constraints.

References SurrBasedMinimizer::augLagrangeMult, Minimizer::bigRealBoundSize, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, Minimizer::objective(), and SurrBasedMinimizer::penaltyParameter.

Referenced by SurrBasedLocalMinimizer::approx\_subprob\_objective\_eval(), EffGlobalMinimizer::get\_best\_sample(), EffGlobalMinimizer::minimize\_surrogates\_on\_model(), and SurrBasedLocalMinimizer::tr\_ratio\_check().

**43.134.2.8 Real penalty\_merit (const RealVector & *fn\_vals*, const RealVector & *primary\_wts*) [protected]**

compute a penalty function from a set of function values The penalty function computation applies a quadratic penalty to any constraint violations and adds this to the objective function(s)  $p = f + r_p cv$ .

References SurrBasedMinimizer::constraintViolation(), Minimizer::constraintTol, Minimizer::objective(), and SurrBasedMinimizer::penaltyParameter.

Referenced by SurrBasedLocalMinimizer::tr\_ratio\_check().

**43.134.2.9 Real constraintViolation (const RealVector & *fn\_vals*, const Real & *constraint\_tol*) [protected]**

compute the constraint violation from a set of function values Compute the quadratic constraint violation defined as  $cv = g+^T g+ + h+^T h+$ . This implementation supports equality constraints and 2-sided inequalities. The constraint\_tol allows for a small constraint infeasibility (used for penalty methods, but not Lagrangian methods).

References Minimizer::bigRealBoundSize, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, and SurrBasedMinimizer::origNonlinIneqUpperBnds.

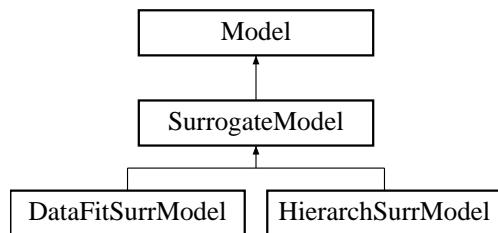

Referenced by SurrBasedLocalMinimizer::hard\_convergence\_check(), EffGlobalMinimizer::minimize\_-surrogates\_on\_model(), SurrBasedMinimizer::penalty\_merit(), SurrBasedLocalMinimizer::relax\_-constraints(), SurrBasedLocalMinimizer::tr\_ratio\_check(), SurrBasedMinimizer::update\_filter(), and SurrBasedLocalMinimizer::update\_penalty().

- **Constraints truthModelCons**  
*copy of the truth model constraints object used to simplify conversion among differing variable views in [force\\_rebuild\(\)](#)*

### 43.135.1 Detailed Description

Base class for surrogate models ([DataFitSurrModel](#) and [HierarchSurrModel](#)). The [SurrogateModel](#) class provides common functions to derived classes for computing and applying corrections to approximations.

### 43.135.2 Member Function Documentation

#### 43.135.2.1 bool force\_rebuild () [protected, virtual]

evaluate whether a rebuild of the approximation should be forced based on changes in the inactive data This function forces a rebuild of the approximation according to the sub-model variables view, the approximation type, and whether the active approximation bounds or inactive variable values have changed since the last approximation build.

Reimplemented from [Model](#).

References Constraints::all\_continuous\_lower\_bounds(), Constraints::all\_continuous\_upper\_bounds(), Variables::all\_continuous\_variables(), Constraints::all\_discrete\_int\_lower\_bounds(), Constraints::all\_discrete\_int\_upper\_bounds(), Variables::all\_discrete\_int\_variables(), Constraints::all\_discrete\_real\_lower\_bounds(), Constraints::all\_discrete\_real\_upper\_bounds(), Variables::all\_discrete\_real\_variables(), String::begins(), Model::continuous\_lower\_bounds(), Constraints::continuous\_lower\_bounds(), Model::continuous\_upper\_bounds(), Constraints::continuous\_upper\_bounds(), Variables::continuous\_variables(), Constraints::copy(), Variables::copy(), Model::current\_variables(), Model::currentVariables, Model::discrete\_int\_lower\_bounds(), Constraints::discrete\_int\_lower\_bounds(), Model::discrete\_int\_upper\_bounds(), Constraints::discrete\_int\_upper\_bounds(), Variables::discrete\_int\_variables(), Model::discrete\_real\_lower\_bounds(), Constraints::discrete\_real\_lower\_bounds(), Model::discrete\_real\_upper\_bounds(), Constraints::discrete\_real\_upper\_bounds(), Variables::discrete\_real\_variables(), Variables::inactive\_continuous\_variables(), Variables::inactive\_discrete\_int\_variables(), Variables::inactive\_discrete\_real\_variables(), Constraints::is\_null(), Variables::is\_null(), Model::is\_null(), Model::model\_type(), SurrogateModel::referenceCLBnds, SurrogateModel::referenceCUBnds, SurrogateModel::referenceDILBnds, SurrogateModel::referenceDIUBnds, SurrogateModel::referenceDRLBnds, SurrogateModel::referenceDRUBnds, SurrogateModel::referenceICVars, SurrogateModel::referenceIDIVars, SurrogateModel::referenceIDRVars, Model::subordinate\_model(), Model::surrogateType, Model::truth\_model(), SurrogateModel::truthModelCons, SurrogateModel::truthModelVars, Model::user\_defined\_constraints(), Model::userDefinedConstraints, and Variables::view().

## 43.136 SysCallAnalysisCode Class Reference

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using system calls. Inheritance diagram for SysCallAnalysisCode::

### Public Member Functions

- [`SysCallAnalysisCode`](#) (const [ProblemDescDB](#) &problem\_db)  
*constructor*
- [`~SysCallAnalysisCode`](#) ()  
*destructor*
- void [`spawn\_evaluation`](#) (const bool block\_flag)  
*spawn a complete function evaluation*
- void [`spawn\_input\_filter`](#) (const bool block\_flag)  
*spawn the input filter portion of a function evaluation*
- void [`spawn\_analysis`](#) (const int &analysis\_id, const bool block\_flag)  
*spawn a single analysis as part of a function evaluation*
- void [`spawn\_output\_filter`](#) (const bool block\_flag)  
*spawn the output filter portion of a function evaluation*

### 43.136.1 Detailed Description

Derived class in the [AnalysisCode](#) class hierarchy which spawns simulations using system calls. [SysCallAnalysisCode](#) creates separate simulation processes using the C `system()` command. It utilizes [CommandShell](#) to manage shell syntax and asynchronous invocations.

### 43.136.2 Member Function Documentation

#### 43.136.2.1 void [`spawn\_evaluation`](#) (const bool *block\_flag*)

*spawn a complete function evaluation Put the [SysCallAnalysisCode](#) to the shell. This function is used when all portions of the function evaluation (i.e., all analysis drivers) are executed on the local processor.*

References CommandShell::asynch\_flag(), AnalysisCode::commandLineArgs, AnalysisCode::curWorkdir, Dakota::flush(), AnalysisCode::iFilterName, AnalysisCode::multipleParamsFiles, AnalysisCode::numPrograms, AnalysisCode::oFilterName, AnalysisCode::paramsFileName, AnalysisCode::programNames, AnalysisCode::resultsFileName, CommandShell::suppress\_output\_flag(), AnalysisCode::suppressOutputFlag, and AnalysisCode::useWorkdir.

Referenced by Dakota::perform\_analysis(), and SysCallApplicInterface::spawn\_application().

#### **43.136.2.2 void spawn\_input\_filter (const bool *block\_flag*)**

spawn the input filter portion of a function evaluation Put the input filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null input filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

References CommandShell::asynch\_flag(), AnalysisCode::commandLineArgs, AnalysisCode::curWorkdir, Dakota::flush(), AnalysisCode::iFilterName, AnalysisCode::paramsFileName, AnalysisCode::resultsFileName, CommandShell::suppress\_output\_flag(), AnalysisCode::suppressOutputFlag, and AnalysisCode::useWorkdir.

Referenced by SysCallApplicInterface::spawn\_application().

#### **43.136.2.3 void spawn\_analysis (const int & *analysis\_id*, const bool *block\_flag*)**

spawn a single analysis as part of a function evaluation Put a single analysis to the shell. This function is used when multiple analysis drivers are spread between processors. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

References CommandShell::asynch\_flag(), AnalysisCode::commandLineArgs, AnalysisCode::curWorkdir, Dakota::flush(), AnalysisCode::multipleParamsFiles, AnalysisCode::numPrograms, AnalysisCode::paramsFileName, AnalysisCode::programNames, AnalysisCode::resultsFileName, CommandShell::suppress\_output\_flag(), AnalysisCode::suppressOutputFlag, and AnalysisCode::useWorkdir.

Referenced by SysCallApplicInterface::derived\_synchronous\_local\_analysis(), GridApplicInterface::derived\_synchronous\_local\_analysis(), and SysCallApplicInterface::spawn\_application().

#### **43.136.2.4 void spawn\_output\_filter (const bool *block\_flag*)**

spawn the output filter portion of a function evaluation Put the output filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null output filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

References CommandShell::asynch\_flag(), AnalysisCode::commandLineArgs, AnalysisCode::curWorkdir, Dakota::flush(), AnalysisCode::oFilterName, AnalysisCode::paramsFileName, AnalysisCode::resultsFileName, CommandShell::suppress\_output\_flag(), AnalysisCode::suppressOutputFlag, and AnalysisCode::useWorkdir.

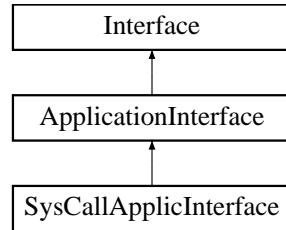

Referenced by SysCallApplicInterface::spawn\_application().

- SysCallAnalysisCode.H
- SysCallAnalysisCode.C

## 43.137 SysCallApplicInterface Class Reference

Derived application interface class which spawns simulation codes using system calls. Inheritance diagram for SysCallApplicInterface::

### Public Member Functions

- `SysCallApplicInterface (const ProblemDescDB &problem_db)`  
*constructor*
- `~SysCallApplicInterface ()`  
*destructor*
- `void derived_map (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)`  
*Called by `map()` and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*
- `void derived_map_asynch (const ParamResponsePair &pair)`  
*Called by `map()` and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*
- `void derived_synch (PRPQueue &prp_queue)`
- `void derived_synch_nowait (PRPQueue &prp_queue)`
- `int derived_synchronous_local_analysis (const int &analysis_id)`
- `const std::vector< String > & analysis_drivers () const`  
*retrieve the analysis drivers specification for application interfaces*
- `const AnalysisCode * analysis_code () const`  
*return `AnalysisCode::fileNameMap` when defined for derived `Interface` class*

### Private Member Functions

- `void spawn_application (const bool block_flag)`  
*Spawn the application by managing the input filter, analysis drivers, and output filter. Called from `derived_map()` & `derived_map_asynch()`.*

- void [derived\\_synch\\_kernel](#) (PRPQueue &prp\_queue)  
*Convenience function for common code between [derived\\_synch\(\)](#) & [derived\\_synch\\_nowait\(\)](#).*
- bool [system\\_call\\_file\\_test](#) (const std::string &root\_file)  
*detect completion of a function evaluation through existence of the necessary results file(s)*

## Private Attributes

- SysCallAnalysisCode [sysCallSimulator](#)  
*SysCallAnalysisCode provides convenience functions for passing the input filter, the analysis drivers, and the output filter to a [CommandShell](#) in various combinations.*
- IntSet [sysCallSet](#)  
*set of function evaluation id's for active asynchronous system call evaluations*
- IntShortMap [failCountMap](#)  
*map linking function evaluation id's to number of response read failures*

### 43.137.1 Detailed Description

Derived application interface class which spawns simulation codes using system calls. [SysCallApplicInterface](#) uses a [SysCallAnalysisCode](#) object for performing simulation invocations.

### 43.137.2 Member Function Documentation

#### 43.137.2.1 void [derived\\_synch](#) (PRPQueue & *prp\_queue*) [inline, virtual]

Check for completion of active asynch jobs (tracked with sysCallSet). Wait for at least one completion and complete all jobs that have returned. This satisfies a "fairness" principle, in the sense that a completed job will \_always\_ be processed (whereas accepting only a single completion could always accept the same completion - the case of very inexpensive fn. evals. - and starve some servers).

Reimplemented from [ApplicationInterface](#).

References [ApplicationInterface::completionSet](#), and [SysCallApplicInterface::derived\\_synch\\_kernel\(\)](#).

#### 43.137.2.2 void [derived\\_synch\\_nowait](#) (PRPQueue & *prp\_queue*) [inline, virtual]

Check for completion of active asynch jobs (tracked with sysCallSet). Make one pass through sysCallSet & complete all jobs that have returned.

Reimplemented from [ApplicationInterface](#).

References [SysCallApplicInterface::derived\\_synch\\_kernel\(\)](#).

**43.137.2.3 int derived\_synchronous\_local\_analysis (const int & *analysis\_id*) [inline, virtual]**

This code provides the derived function used by [ApplicationInterface::serve\\_analyses\\_synch\(\)](#).

Reimplemented from [ApplicationInterface](#).

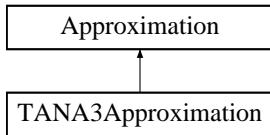

References [SysCallAnalysisCode::spawn\\_analysis\(\)](#), and [SysCallApplicInterface::sysCallSimulator](#).

The documentation for this class was generated from the following files:

- [SysCallApplicInterface.H](#)
- [SysCallApplicInterface.C](#)

## 43.138 TANA3Approximation Class Reference

Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation). Inheritance diagram for TANA3Approximation::

*compute TANA coefficients based on scaled inputs*
- void [offset \(const RealVector &x, RealVector &s\)](#)  
*based on minX, apply offset scaling to x to define s*

## Private Attributes

- RealVector [pExp](#)  
*vector of exponent values*
- RealVector [minX](#)  
*vector of minimum parameter values used in scaling*
- RealVector [scX1](#)  
*vector of scaled x1 values*
- RealVector [scX2](#)  
*vector of scaled x2 values*
- Real [H](#)  
*the scalar Hessian value in the TANA-3 approximation*

### 43.138.1 Detailed Description

Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation). The [TANA3Approximation](#) class provides a multipoint approximation based on matching value and gradient data from two points (typically the current and previous iterates) in parameter space. It forms an exponential approximation in terms of intervening variables.

### 43.138.2 Member Function Documentation

#### 43.138.2.1 void [build \(\) \[protected, virtual\]](#)

builds the approximation from scratch This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References Dakota::abort\_handler(), Approximation::approxData, Approximation::buildDataOrder, TANA3Approximation::find\_scaled\_coefficients(), TANA3Approximation::minX, Approximation::numVars, and TANA3Approximation::pExp.

**43.138.2.2 void clear\_current () [inline, protected, virtual]**

Redefine default implementation to support history mechanism.

Reimplemented from [Approximation](#).

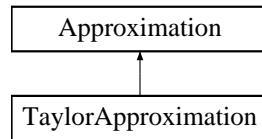

References Approximation::approxData.

The documentation for this class was generated from the following files:

- TANA3Approximation.H
- TANA3Approximation.C

## 43.139 TaylorApproximation Class Reference

Derived approximation class for first- or second-order Taylor series (a local approximation). Inheritance diagram for TaylorApproximation::

### Public Member Functions

- [TaylorApproximation \(\)](#)  
*default constructor*
- [TaylorApproximation \(ProblemDescDB &problem\\_db, size\\_t num\\_vars\)](#)  
*standard constructor*
- [TaylorApproximation \(size\\_t num\\_vars, short data\\_order\)](#)  
*alternate constructor*
- [~TaylorApproximation \(\)](#)  
*destructor*

### Protected Member Functions

- [int min\\_coefficients \(\) const](#)  
*return the minimum number of samples (unknowns) required to build the derived class approximation type in num-Vars dimensions*
- [void build \(\)](#)  
*builds the approximation from scratch*
- [Real get\\_value \(const RealVector &x\)](#)  
*retrieve the approximate function value for a given parameter vector*

*retrieve the approximate function gradient for a given parameter vector*
- [const RealSymMatrix & get\\_hessian \(const RealVector &x\)](#)  
*retrieve the approximate function Hessian for a given parameter vector*

### 43.139.1 Detailed Description

Derived approximation class for first- or second-order Taylor series (a local approximation). The [TaylorApproximation](#) class provides a local approximation based on data from a single point in parameter space. It uses a zeroth-, first- or second-order Taylor series expansion:  $f(x) = f(x_c)$  for zeroth-order, plus  $\text{grad}(x_c)'(x - x_c)$  for first- and second-order, and plus  $(x - x_c)' \text{Hess}(x_c)(x - x_c) / 2$  for second-order.

### 43.139.2 Member Function Documentation

#### 43.139.2.1 void build() [protected, virtual]

builds the approximation from scratch This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from [Approximation](#).

References Dakota::abort\_handler(), Approximation::approxData, Approximation::buildDataOrder, and Approximation::numVars.

The documentation for this class was generated from the following files:

- TaylorApproximation.H
- TaylorApproximation.C

## 43.140 TrackerHTTP Class Reference

[TrackerHTTP](#): a usage tracking module that uses HTTP/HTTPS via the curl library.

### Public Member Functions

- [`TrackerHTTP \(\)`](#)  
*default constructor is allowed, but doesn't track methods used and outputs on all ranks*
- [`TrackerHTTP \(ProblemDescDB &problem\_db, int world\_rank=0\)`](#)  
*standard constructor with `ProblemDescDB`, rank*
- [`~TrackerHTTP \(\)`](#)  
*destructor to free handles*
- [`void post\_start \(\)`](#)  
*post the start of an analysis and archive start time*
- [`void post\_finish \(unsigned runtime=0\)`](#)  
*post the completion of an analysis including elapsed time*

### Private Member Functions

- [`void initialize \(int world\_rank=0\)`](#)  
*shared initialization functions across constructors*
- [`void url\_add\_field \(std::string &url, const char \*keyword, const std::string &value, bool delimit=true\) const`](#)  
*append keyword/value pair to url in GET style (with `&keyword=value`); set `delimit = false` to omit the &*
- [`void build\_default\_data \(std::string &url, std::time\_t &rawtime, const std::string &mode\) const`](#)  
*construct URL with shared information for start/finish*
- [`void send\_data\_using\_get \(const std::string &curltopost\) const`](#)  
*transmit data to the web server using GET*

### 43.141.1 Detailed Description

Base class for the variables class hierarchy. The [Variables](#) class is the base class for the class hierarchy providing design, uncertain, and state variables for continuous and discrete domains within a [Model](#). Using the fundamental arrays from the input specification, different derived classes define different views of the data. For memory efficiency and enhanced polymorphism, the variables hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class ([Variables](#)) serves as the envelope and one of the derived classes (selected in [Variables::get\\_variables\(\)](#)) serves as the letter.

### 43.141.2 Constructor & Destructor Documentation

#### 43.141.2.1 Variables ()

default constructor The default constructor: variablesRep is NULL in this case (a populated problem\_db is needed to build a meaningful [Variables](#) object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

#### 43.141.2.2 Variables (const ProblemDescDB & *problem\_db*)

standard constructor This is the primary envelope constructor which uses problem\_db to build a fully populated variables object. It only needs to extract enough data to properly execute get\_variables(problem\_db), since the constructor overloaded with [BaseConstructor](#) builds the actual base class data inherited by the derived classes.

References Dakota::abort\_handler(), [Variables::get\\_variables\(\)](#), and [Variables::variablesRep](#).

#### 43.141.2.3 Variables (const SharedVariablesData & *svd*)

alternate constructor for instantiations on the fly This is the alternate envelope constructor for instantiations on the fly. This constructor executes get\_variables(view), which invokes the default derived/base constructors, followed by a resize() based on vars\_comps.

References Dakota::abort\_handler(), [Variables::get\\_variables\(\)](#), and [Variables::variablesRep](#).

#### 43.141.2.4 Variables (const Variables & *vars*)

copy constructor Copy constructor manages sharing of variablesRep and incrementing of referenceCount.

References [Variables::referenceCount](#), and [Variables::variablesRep](#).

#### 43.141.2.5 ~Variables () [virtual]

destructor Destructor decrements referenceCount and only deletes variablesRep when referenceCount reaches zero.

References [Variables::referenceCount](#), and [Variables::variablesRep](#).

#### 43.141.2.6 Variables (BaseConstructor, const ProblemDescDB & *problem\_db*, const std::pair< short, short > & *view*) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get\\_variables\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_variables\(\)](#) again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Variables).

#### 43.141.2.7 Variables (BaseConstructor, const SharedVariablesData & *svd*) [protected]

constructor initializes the base class part of letter classes ([BaseConstructor](#) overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139) This constructor is the one which must build the base class data for all derived classes. [get\\_variables\(\)](#) instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling [get\\_variables\(\)](#) again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Variables).

### 43.141.3 Member Function Documentation

#### 43.141.3.1 Variables operator= (const Variables & *vars*)

assignment operator Assignment operator decrements referenceCount for old variablesRep, assigns new variablesRep, and increments referenceCount for new variablesRep.

References Variables::referenceCount, and Variables::variablesRep.

#### 43.141.3.2 Variables copy () const

for use when a deep copy is needed (the representation is \_not\_ shared) Deep copies are used for history mechanisms such as bestVariablesArray and data\_pairs since these must catalogue copies (and should not change as the representation within currentVariables changes).

References Variables::allContinuousVars, Variables::allDiscreteIntVars, Variables::allDiscreteRealVars, Variables::build\_views(), Variables::get\_variables(), Variables::sharedVarsData, and Variables::variablesRep.

- DakotaVariables.C

## 43.142 Verification Class Reference

Base class for managing common aspects of verification studies. Inheritance diagram for Verification::

### Protected Member Functions

- [Verification \(Model &model\)](#)  
*constructor*
- [Verification \(NoDBBaseConstructor, Model &model\)](#)  
*alternate constructor for instantiations "on the fly"*
- [`~Verification \(\)`](#)  
*destructor*
- [`void run \(\)`](#)  
*run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post*
- [`void print\_results \(std::ostream &s\)`](#)  
*print the final iterator results*
- [`virtual void perform\_verification \(\)=0`](#)  
*Redefines the run\_iterator virtual function for the PStudy/DACE branch.*

### 43.142.1 Detailed Description

Base class for managing common aspects of verification studies. The [Verification](#) base class manages common data and functions, such as those involving ...

## 43.142.2 Member Function Documentation

### 43.142.2.1 void run () [inline, protected, virtual]

run portion of run\_iterator; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from [Iterator](#).

References Verification::perform\_verification().

### 43.142.2.2 void print\_results (std::ostream & s) [protected, virtual]

print the final iterator results This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in [finalize\\_run\(\)](#).

Reimplemented from [Analyzer](#).

Reimplemented in [RichExtrapVerification](#).

The documentation for this class was generated from the following files:

- DakotaVerification.H
- DakotaVerification.C

# Chapter 44

## File Documentation

### 44.1 `dll_api.C` File Reference

This file contains a `DakotaRunner` class, which launches DAKOTA.

#### Namespaces

- namespace `Dakota`  
*The primary namespace for DAKOTA.*

#### Functions

- void DAKOTA\_DLL\_FN `dakota_create` (int \*dakota\_ptr\_int, char \*logname)  
*create and configure a new DakotaRunner, adding it to list of instances*
- int DAKOTA\_DLL\_FN `dakota_readInput` (int id, char \*dakotaInput)  
*command DakotaRunner instance id to read from file dakotaInput*
- void DAKOTA\_DLL\_FN `dakota_get_variable_info` (int id, char \*\*\*pVarNames, int \*pNumVarNames, char \*\*\*pRespNames, int \*pNumRespNames)  
*return the variable and response names*
- int DAKOTA\_DLL\_FN `dakota_start` (int id)  
*command DakotaRunner instance id to start (plugin interface and run strategy)*
- void DAKOTA\_DLL\_FN `dakota_destroy` (int id)  
*delete Dakota runner instance id and remove from active list*
- void DAKOTA\_DLL\_FN `dakota_stop` (int \*id)  
*command DakotaRunner instance id to stop execution*

- const char \*DAKOTA\_DLL\_FN `dakota_getStatus` (int id)  
*return current results output as a string*
- int `get_mc_ptr_int` ()  
*get the DAKOTA pointer to ModelCenter*
- void `set_mc_ptr_int` (int ptr\_int)  
*set the DAKOTA pointer to ModelCenter*
- int `get_dc_ptr_int` ()  
*get the DAKOTA pointer to ModelCenter current design point*
- void `set_dc_ptr_int` (int ptr\_int)  
*set the DAKOTA pointer to ModelCenter current design point*

## Variables

- PRPCache `data_pairs`  
*contains all parameter/response pairs.*

### 44.1.1 Detailed Description

This file contains a DakotaRunner class, which launches DAKOTA.

### 44.1.2 Function Documentation

#### 44.1.2.1 void DAKOTA\_DLL\_FN `dakota_stop` (int \* *id*)

command DakotaRunner instance id to stop execution

TODO: trick application to quit through the syscall interface or throw exception.

## 44.2 dll\_api.h File Reference

API for DLL interactions.

### Functions

- void DAKOTA\_DLL\_FN `dakota_create` (int \*dakota\_ptr\_int, char \*logname)  
*create and configure a new DakotaRunner, adding it to list of instances*
- int DAKOTA\_DLL\_FN `dakota_readInput` (int id, char \*dakotaInput)

*return the variable and response names*

### 44.2.1 Detailed Description

API for DLL interactions.

## 44.2.2 Function Documentation

### 44.2.2.1 void DAKOTA\_DLL\_FN dakota\_stop (int \* *id*)

command DakotaRunner instance id to stop execution

TODO: trick application to quit through the syscall interface or throw exception.

## 44.3 JEGAOptimizer.C File Reference

Contains the implementation of the JEGAOptimizer class.

### Classes

- class [Evaluator](#)

*An evaluator specialization that knows how to interact with Dakota.*

- class [EvaluatorCreator](#)

*A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.*

- class [Driver](#)

*A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.*

### Namespaces

- namespace [Dakota](#)

*The primary namespace for DAKOTA.*

### Functions

- template<typename T >  
string [asstring](#) (const T &val)

*Creates a string from the argument val using an ostringstream.*

#### 44.3.1 Detailed Description

Contains the implementation of the JEGAOptimizer class.

## 44.4 JEGAOptimizer.H File Reference

Contains the definition of the JEGAOptimizer class.

### Classes

- class [JEGAOptimizer](#)

*A version of Dakota::Optimizer for instantiation of John Eddy's Genetic Algorithms (JEGA).*

### Namespaces

- namespace [Dakota](#)

*The primary namespace for DAKOTA.*

#### 44.4.1 Detailed Description

Contains the definition of the JEGAOptimizer class.

## 44.5 library\_mode.C File Reference

file containing a mock simulator main for testing DAKOTA in library mode

### Namespaces

- namespace Dakota  
*The primary namespace for DAKOTA.*

### Functions

- void [nidr\\_set\\_input\\_string](#) (const char \*)  
*Set input to NIDR via string argument instead of input file.*
- int [nidr\\_save\\_exedir](#) (const char \*, int)
- void [run\\_dakota\\_parse](#) (const char \*dakota\_input\_file)  
*Function to encapsulate the DAKOTA object instantiations for mode 1: parsing an input file.*
- void [run\\_dakota\\_data](#) ()  
*Function to encapsulate the DAKOTA object instantiations for mode 2: direct Data class instantiation.*
- void [run\\_dakota\\_mixed](#) (const char \*dakota\_input\_file)  
*Function to encapsulate the DAKOTA object instantiations for mode 3: mixed parsing and direct updating.*
- void [model\\_interface\\_plugins](#) (Dakota::ProblemDescDB &problem\_db)
- int [main](#) (int argc, char \*argv[ ])  
*A mock simulator main for testing DAKOTA in library mode.*
- static void [my\\_callback\\_function](#) (void \*ptr)

#### 44.5.1 Detailed Description

file containing a mock simulator main for testing DAKOTA in library mode

#### 44.5.2 Function Documentation

##### 44.5.2.1 void [run\\_dakota\\_parse](#) (const char \* *dakota\_input\_file*)

Function to encapsulate the DAKOTA object instantiations for mode 1: parsing an input file. This function parses from an input file to define the ProblemDescDB data.

References ProblemDescDB::lock(), ProblemDescDB::manage\_inputs(), model\_interface\_plugins(), Strategy::run\_strategy(), and ParallelLibrary::world\_rank().

Referenced by main().

#### **44.5.2.2 void run\_dakota\_mixed (const char \* *dakota\_input\_file*)**

Function to encapsulate the DAKOTA object instantiations for mode 3: mixed parsing and direct updating. This function showcases multiple features. For parsing, either an input file (*dakota\_input\_file* != NULL) or a default input string (*dakota\_input\_file* == NULL) are shown. This parsed input is then mixed with input from three sources: (1) input from a user-supplied callback function, (2) updates to the DB prior to Strategy instantiation, (3) updates directly to Iterators/Models following Strategy instantiation.

References ProblemDescDB::broadcast(), ProblemDescDB::get\_dsa(), ProblemDescDB::lock(), model\_interface\_plugins(), ProblemDescDB::model\_list(), ParallelLibrary::mpirun\_flag(), my\_callback\_function(), nidr\_set\_input\_string(), ProblemDescDB::parse\_inputs(), ProblemDescDB::post\_process(), ProblemDescDB::resolve\_top\_method(), Strategy::run\_strategy(), ProblemDescDB::set(), and ParallelLibrary::world\_rank().

Referenced by main().

#### **44.5.2.3 void model\_interface\_plugins (Dakota::ProblemDescDB & *problem\_db*)**

Iterate over models and plugin appropriate interface: serial rosenbrock or parallel textbook.

References Dakota::abort\_handler(), Interface::analysis\_drivers(), Interface::assign\_rep(), Interface::interface\_type(), ProblemDescDB::model\_list(), ParallelLevel::server\_intra\_communicator(), and ProblemDescDB::set\_db\_model\_nodes().

Referenced by Dakota::run\_dakota\_data(), run\_dakota\_mixed(), and run\_dakota\_parse().

#### **44.5.2.4 int main (int *argc*, char \* *argv*[ ])**

A mock simulator main for testing DAKOTA in library mode. Uses alternative instantiation syntax as described in the library mode documentation within the Developers Manual. Tests several problem specification modes: (1) run\_dakota\_parse: reads all problem specification data from an input file (2) run\_dakota\_data: creates all problem specification from direct Data instance instantiations. (3) run\_dakota\_mixed: a mixture of input parsing (by file or default string) and direct data updates, where the data updates occur: (a) via the DB prior to Strategy instantiation, and (b) via Iterators/Models following Strategy instantiation. Usage: dakota\_library\_mode [-m] [dakota.in]

References ParallelLibrary::detect\_parallel\_launch(), Dakota::run\_dakota\_data(), run\_dakota\_mixed(), and run\_dakota\_parse().

#### **44.5.2.5 static void my\_callback\_function (void \* *ptr*) [static]**

Example of user-provided callback function to override input specified and managed by NIDR, e.g., from an input deck.

References ProblemDescDB::get\_dsa(), ProblemDescDB::get\_string(), ProblemDescDB::resolve\_top\_method(), and ProblemDescDB::set().

Referenced by run\_dakota\_mixed().

## 44.6 library\_split.C File Reference

file containing a mock simulator main for testing DAKOTA in library mode on a split communicator

### Functions

- void [manage\\_mpi](#) (MPI\_Comm &my\_comm, int &color)  
*Split MPI\_COMM\_WORLD, returning the comm and color.*
- void [gen\\_dakota\\_input](#) (const int &color, std::string &input)  
*Return the appropriate DAKOTA input based on color (1 or 2).*
- void [run\\_dakota](#) (const MPI\_Comm &comm, const std::string &input, const int &color)  
*Launch DAKOTA on passed communicator, tagging output/error with color.*
- void [collect\\_results](#) ()  
*Wait for and collect results from DAKOTA runs.*
- void [nidr\\_set\\_input\\_string](#) (const char \*)  
*Set input to NIDR via string argument instead of input file.*
- int [main](#) (int argc, char \*argv[ ])  
*Driver routine for testing library mode with partitioned MPI\_Comm. This test fixture requires MPI and can be run on 3-8 processors.*

### 44.6.1 Detailed Description

file containing a mock simulator main for testing DAKOTA in library mode on a split communicator

## 44.7 main.C File Reference

file containing the main program for DAKOTA

### Functions

- void `fpinit_ASL()`
- int `nindr_save_exedir` (const char \*, int)
- int `main` (int argc, char \*argv[ ])

*The main DAKOTA program.*

### 44.7.1 Detailed Description

file containing the main program for DAKOTA

### 44.7.2 Function Documentation

#### 44.7.2.1 void `fpinit_ASL()`

Floating-point initialization from AMPL: switch to 53-bit rounding if appropriate, to eliminate some cross-platform differences.

Referenced by `main()`.

#### 44.7.2.2 int `main` (int *argc*, char \* *argv*[ ])

The main DAKOTA program. Manage command line inputs, input files, restart file(s), output streams, and top level parallel iterator communicators. Instantiate the Strategy and invoke its `run_strategy()` virtual function.

References `Dakota::abort_handler()`, `fpinit_ASL()`, `CommandLineHandler::instantiate_flag()`, `ProblemDescDB::lock()`, `ProblemDescDB::manage_inputs()`, `ParallelLibrary::output_helper()`, `GetLongOpt::retrieve()`, `Strategy::run_strategy()`, `ParallelLibrary::specify_outputs_restart()`, and `ParallelLibrary::world_rank()`.

## 44.8 restart\_util.C File Reference

file containing the DAKOTA restart utility main program

### Namespaces

- namespace [Dakota](#)  
*The primary namespace for DAKOTA.*

### Functions

- void [print\\_restart](#) (int argc, char \*\*argv, [String](#) print\_dest)  
*print a restart file*
- void [print\\_restart\\_tabular](#) (int argc, char \*\*argv, [String](#) print\_dest)  
*print a restart file (tabular format)*
- void [read\\_neutral](#) (int argc, char \*\*argv)  
*read a restart file (neutral file format)*
- void [repair\\_restart](#) (int argc, char \*\*argv, [String](#) identifier\_type)  
*repair a restart file by removing corrupted evaluations*
- void [concatenate\\_restart](#) (int argc, char \*\*argv)  
*concatenate multiple restart files*
- int [nidr\\_save\\_exedir](#) (const char \*, int)
- int [main](#) (int argc, char \*argv[ ])  
*The main program for the DAKOTA restart utility.*

### 44.8.1 Detailed Description

file containing the DAKOTA restart utility main program

### 44.8.2 Function Documentation

#### 44.8.2.1 int [main](#) (int *argc*, char \* *argv*[ ])

The main program for the DAKOTA restart utility. Parse command line inputs and invoke the appropriate utility function ([print\\_restart\(\)](#), [print\\_restart\\_tabular\(\)](#), [read\\_neutral\(\)](#), [repair\\_restart\(\)](#), or [concatenate\\_restart\(\)](#)).

References Dakota::concatenate\_restart(), Dakota::print\_restart(), Dakota::print\_restart\_tabular(), Dakota::read\_neutral(), and Dakota::repair\_restart().
